Puzzle of the Week: Squares

Start with five shaded squares, infinite grid.

At every iteration, color a square if *at least* three neighboring were colored in the previous iteration.

As N gets large, how many squares will be shaded in generation N (as a function of N)?

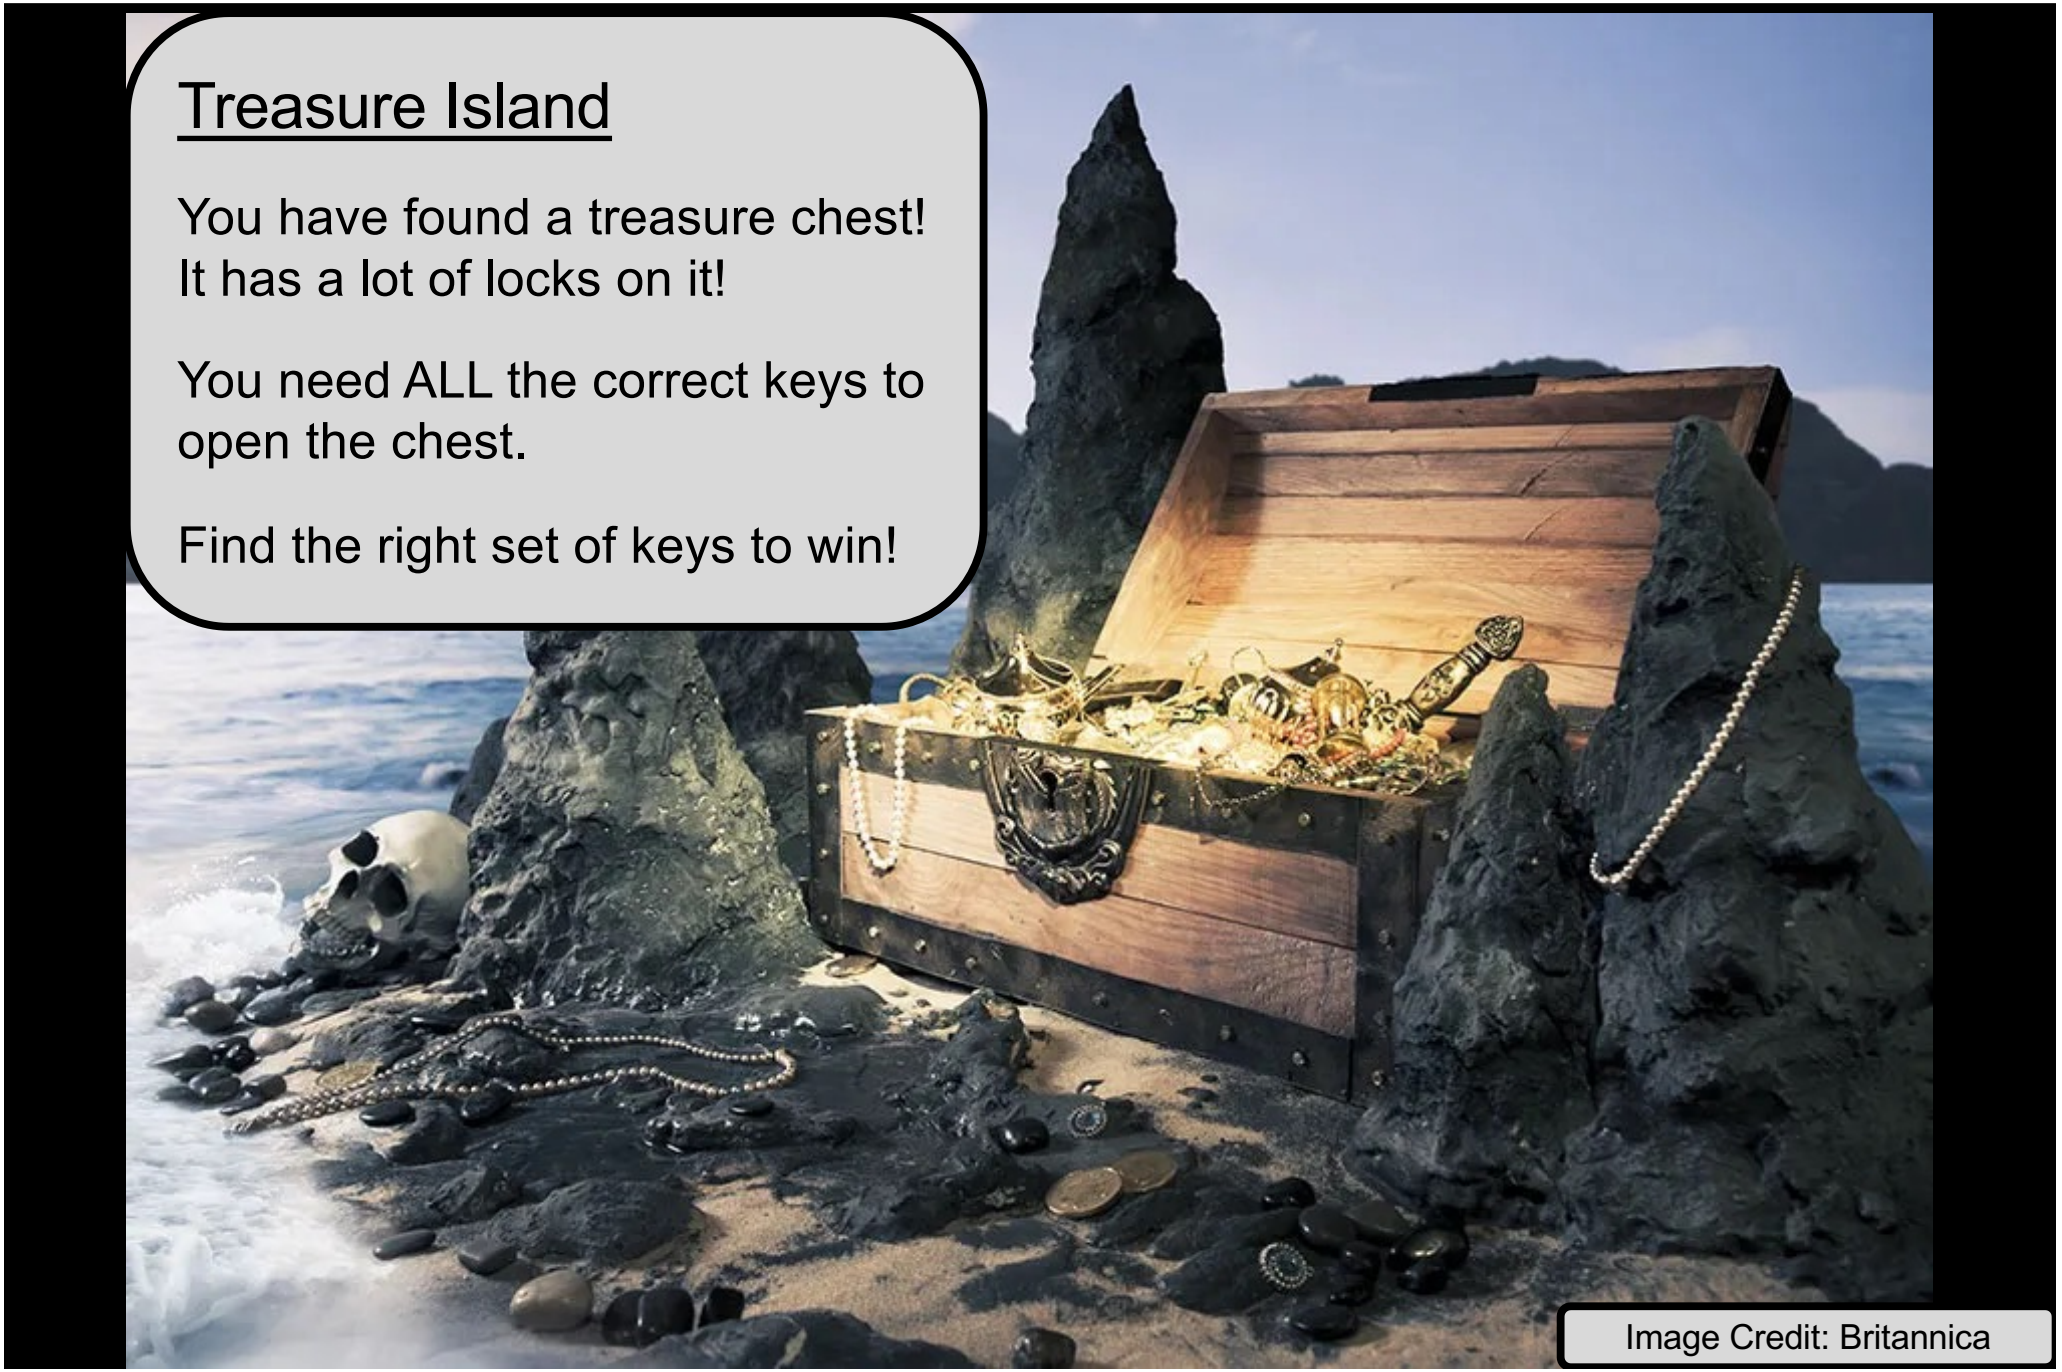
Contest



Treasure Island
You have found a treasure chest! It has a lot of locks on it!
You need ALL the correct keys to open the chest.
Find the right set of keys to win!

Announcements

Midterm : Thursday March 10, 6:30pm

Location: ~14 different venues (MPSH).

Note: In person, face-to-face

Safe distancing: 48 students / room, spaced

Apologies for the delay, and for the evening exam. All alternatives were worse (e.g., same day as CS2100S or CS2030S midterm/practical exam, Saturday night at 8pm after GEA1000 test, etc.)

Plan of the Day

Selection and Order Statistics

- QuickSelect

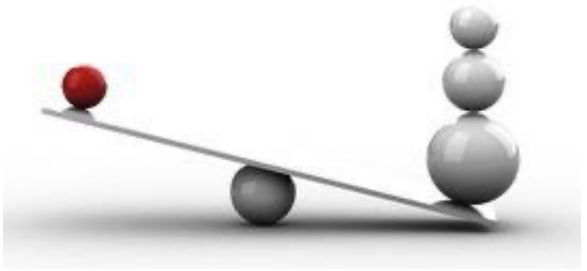
Trees

- Terminology
- Traversals
- Operations

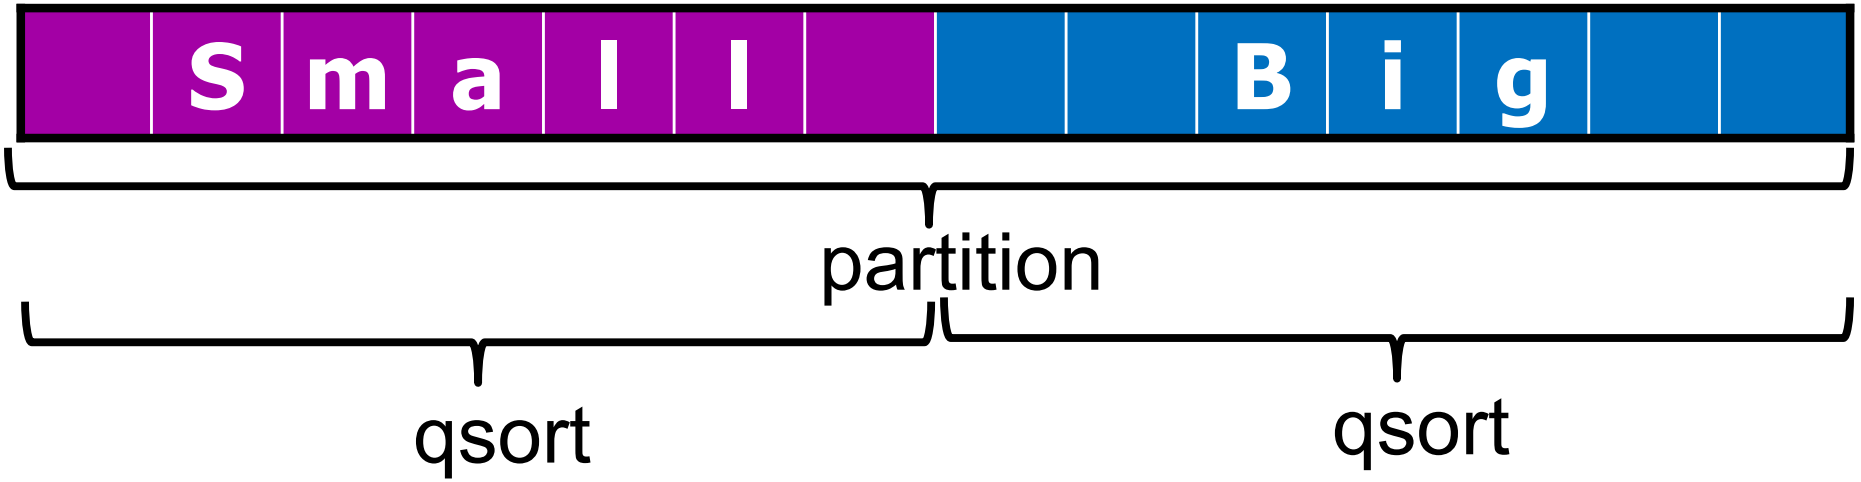
Balanced Trees

- Height-balanced binary search trees
- AVL trees
- Rotations

QuickSort



```
QuickSort(A[1..n], n)
    if (n==1) then return;
    else
        p = partition(A[1..n], n)
        x = QuickSort(A[1..p-1], p-1)
        y = QuickSort(A[p+1..n], n-p)
```



QuickSort

How to partition efficiently?

- Duplicates

  If you ignore duplicates, partitioning can be very slow!

- In-place partitioning

  One pass, use invariants to ensure correctness.

- Stability

  In-place partitioning isn't stable.

- Choosing a pivot (randomization)

  Deterministic pivots are generally bad.

  Randomization is an easy way to find a good pivot!

QuickSort

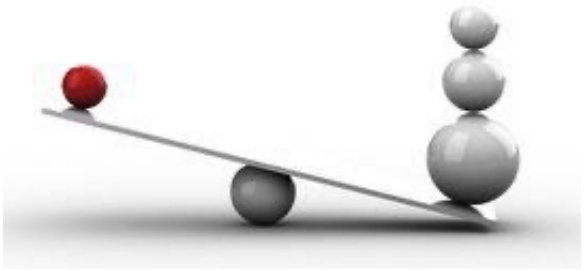
How to analyze?

- Divide-and-conquer recurrence

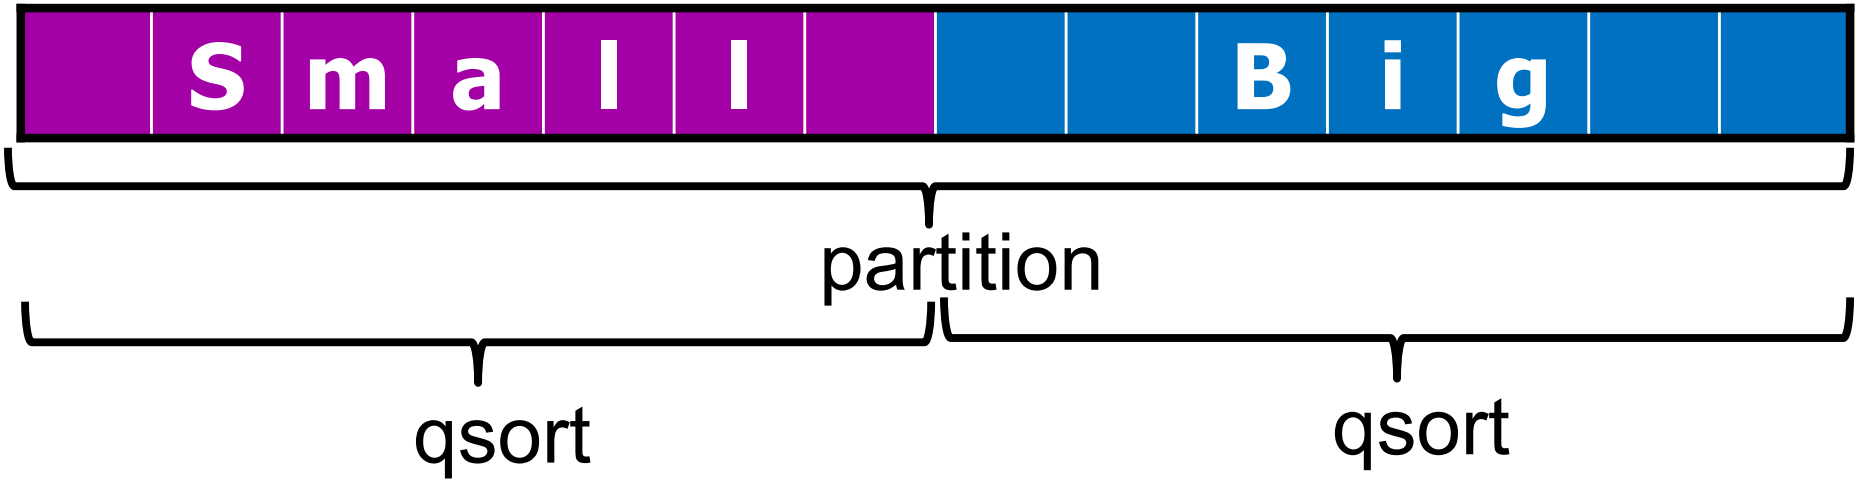
  It is sufficient to do a 90:10 split to get O(n log n) performance!

- What is the probability that a random pivot yields a 90:10 split? Quite good!
- Simplification: Paranoid QuickSort
- How many repetitions to find a good pivot, in expectation? O(1)
- Solve using recurrence: Linearity of expectation FTW.

QuickSort

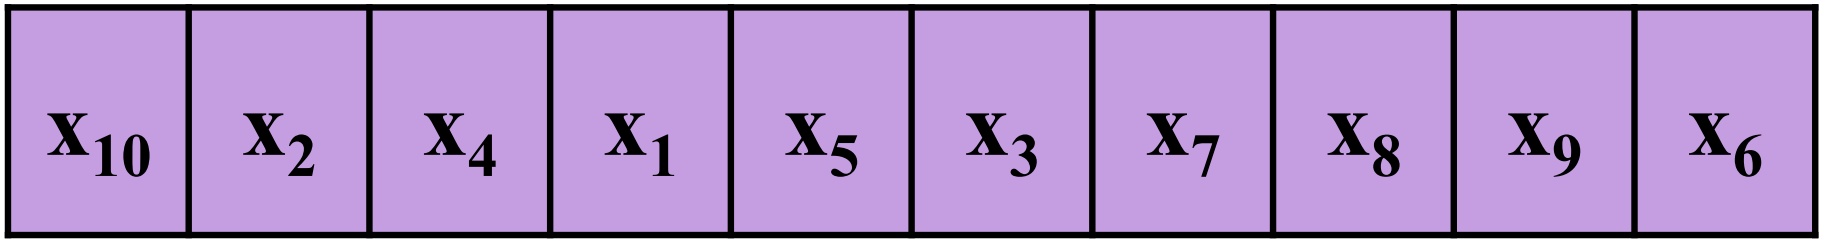


```
QuickSort(A[1..n], n)
    if (n==1) then return;
    else
        p = partition(A[1..n], n)
        x = QuickSort(A[1..p-1], p-1)
        y = QuickSort(A[p+1..n], n-p)
```



Order Statistics

Find k^{th} smallest element in an *unsorted* array:

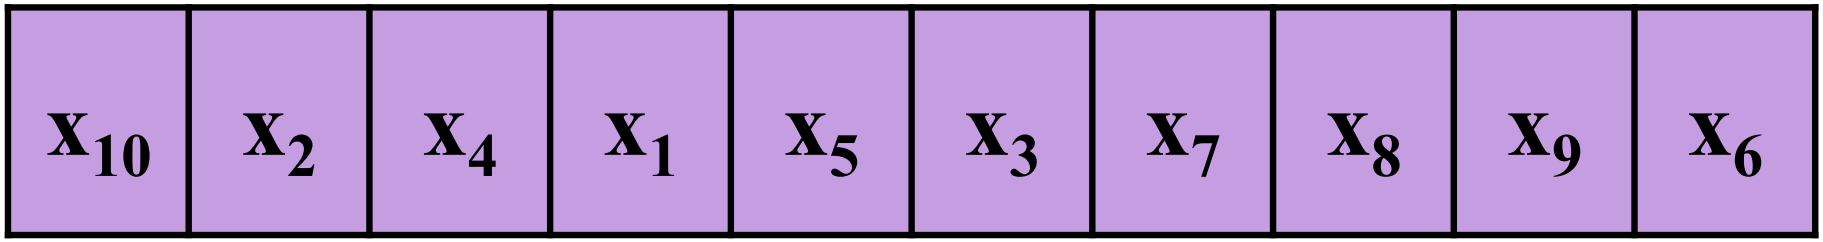


E.g.: Find the median ($k = n/2$)

Find the 7th element ($k = 7$)

Order Statistics

Find k^{th} smallest element in an *unsorted* array:

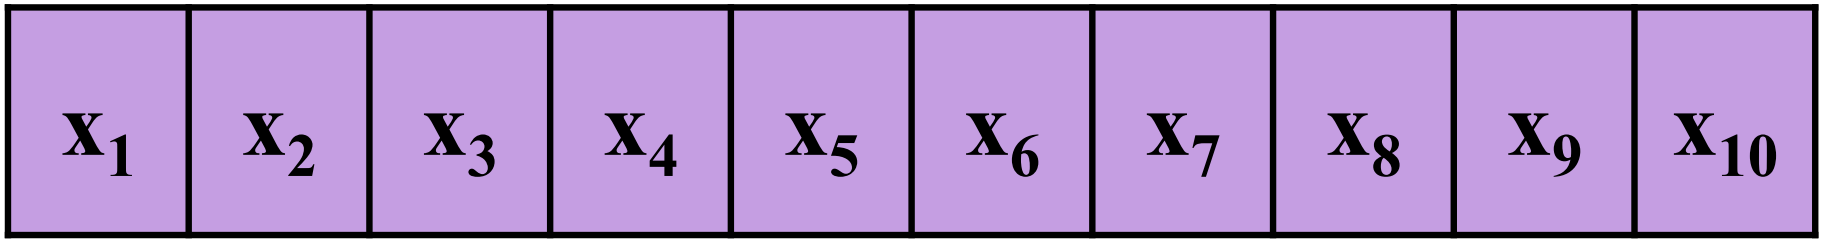


Option 1:

- Sort the array.
- Return element number k.

Order Statistics

Find k^{th} smallest element in an *unsorted* array:



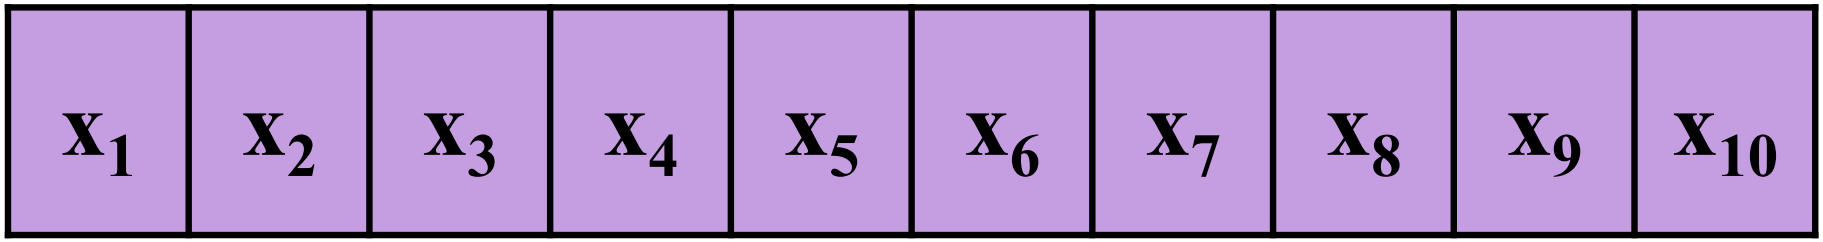
Option 1:

- Sort the array.
- Return element number k.

Running time?

Order Statistics

Find k^{th} smallest element in an *unsorted* array:



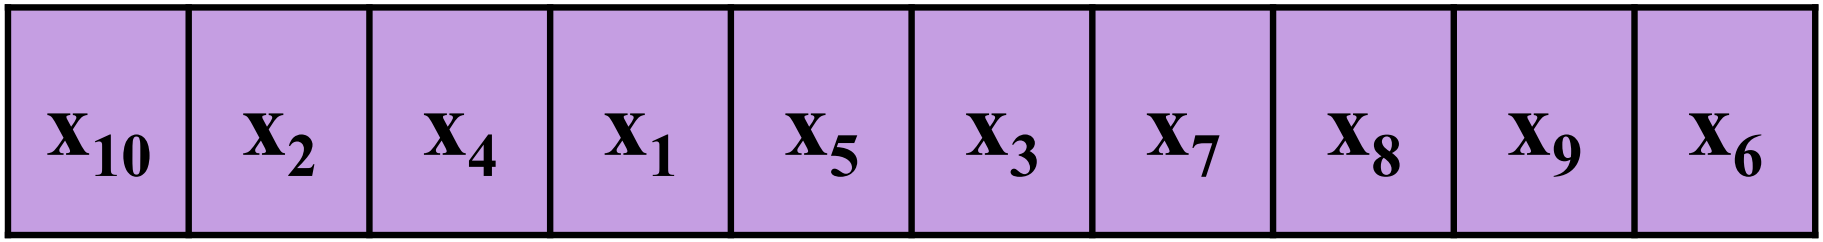
Option 1:

- Sort the array.
- Return element number k.

Running time: O(n log n)

Order Statistics

Find k^{th} smallest element in an *unsorted* array:

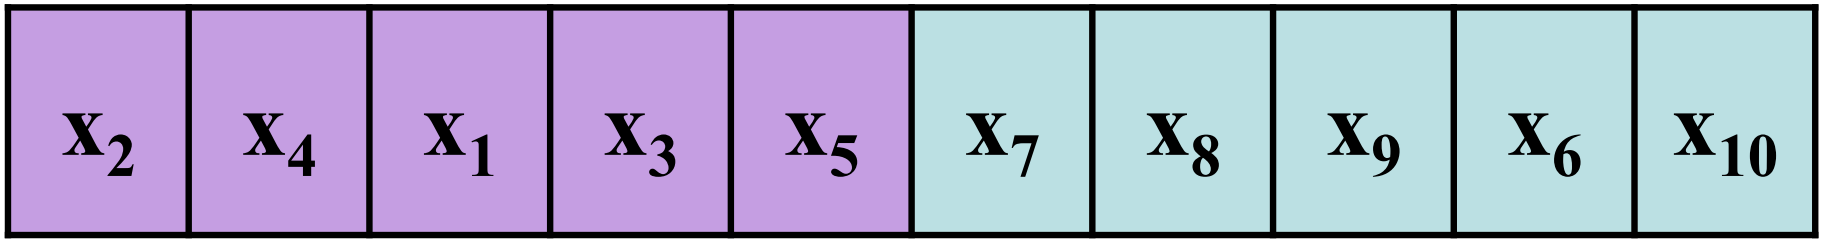


Option 2:

- Only do the minimum amount of sorting necessary

Order Statistics

Key Idea: partition the array

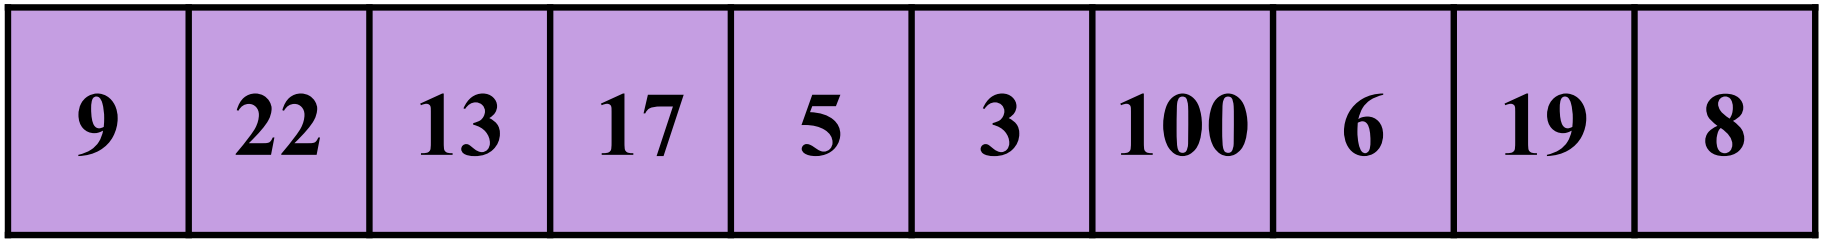


Now continue searching in the correct half.

E.g.: Partition around x_5 and recursively search for x_3 in left half.

Order Statistics

Example: search for 5^{th} element



Order Statistics

Example: search for 5th element

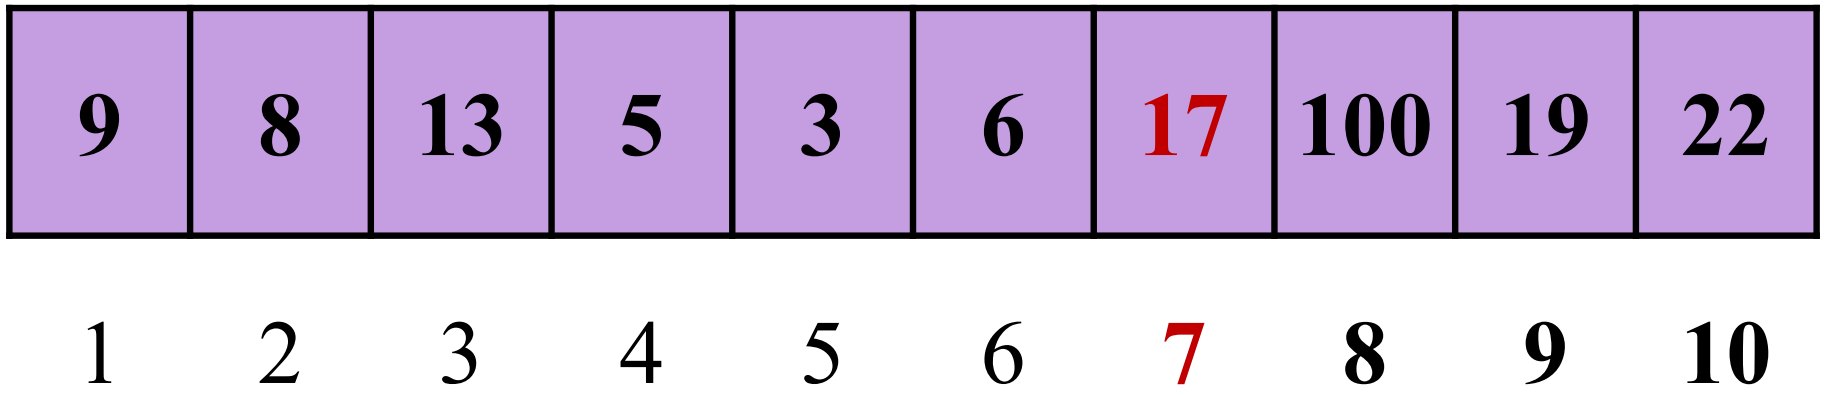
9	22	13	17	5	3	100	6	19	8

Partition around random pivot: 17

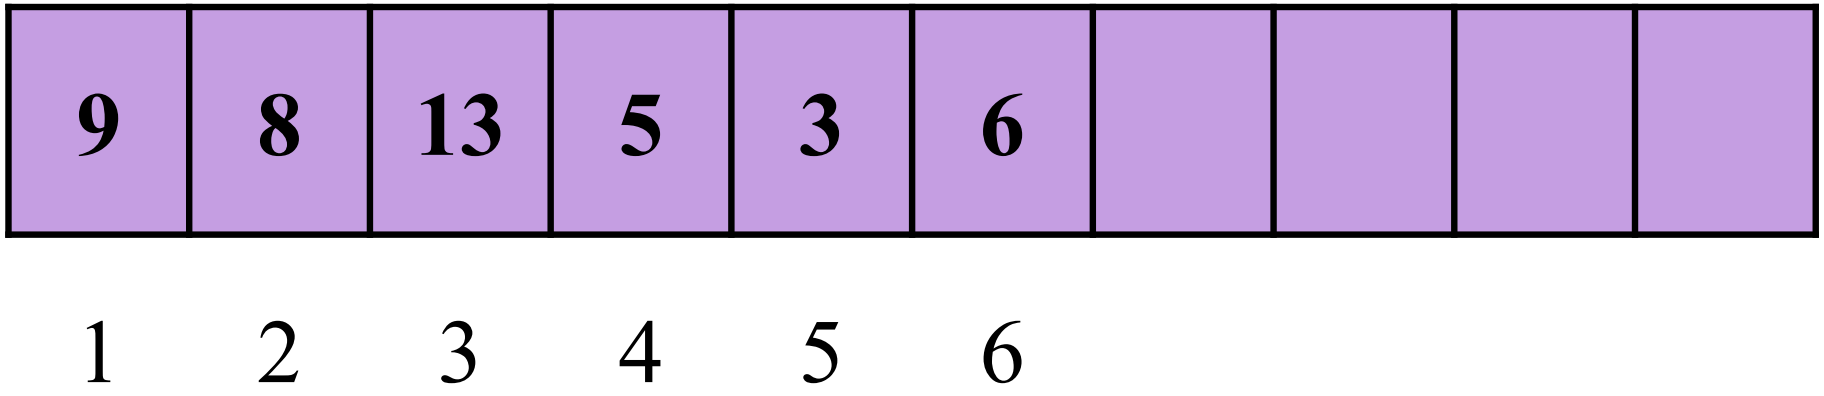
9	8	13	5	3	6	17	100	19	22
1	2	3	4	5	6	**7**	**8**	**9**	**10**

Order Statistics

Example: search for 5th element

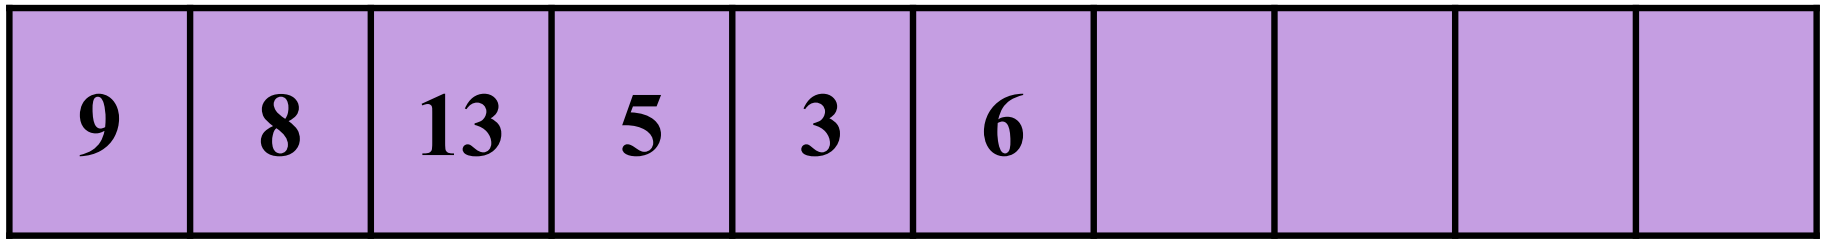


Search for 5th element in left half.

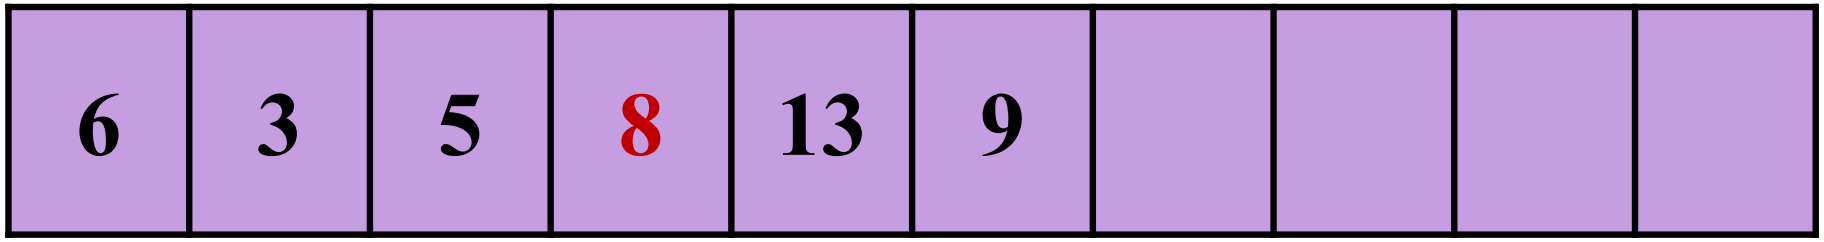


Order Statistics

Example: search for 5^{th} element



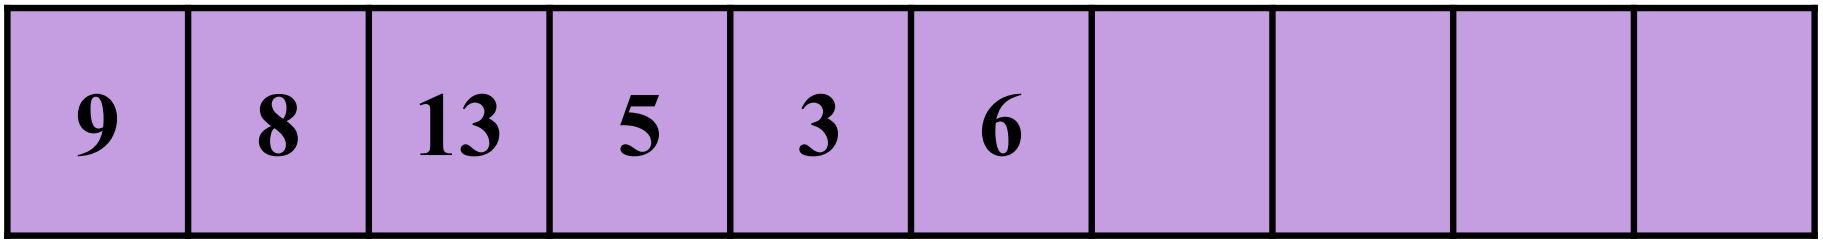
Partition around random pivot: 8



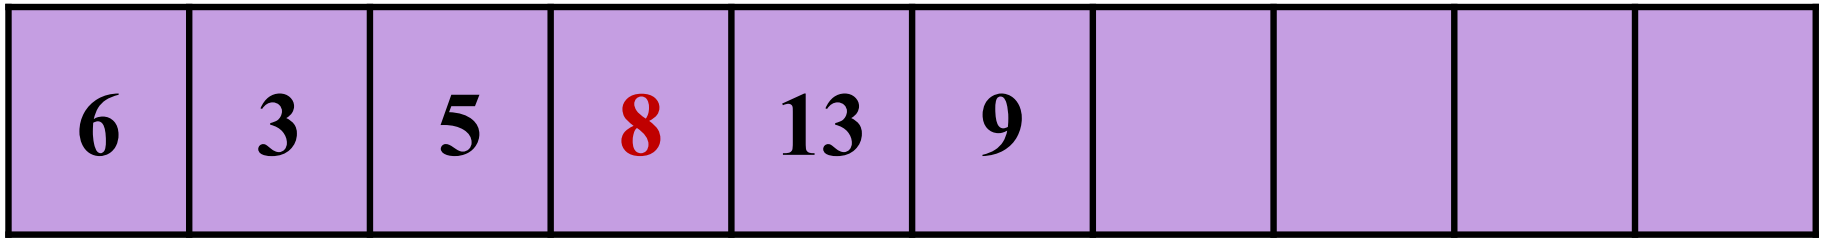
1 2 3 **4** 5 6

Order Statistics

Example: search for 5th element



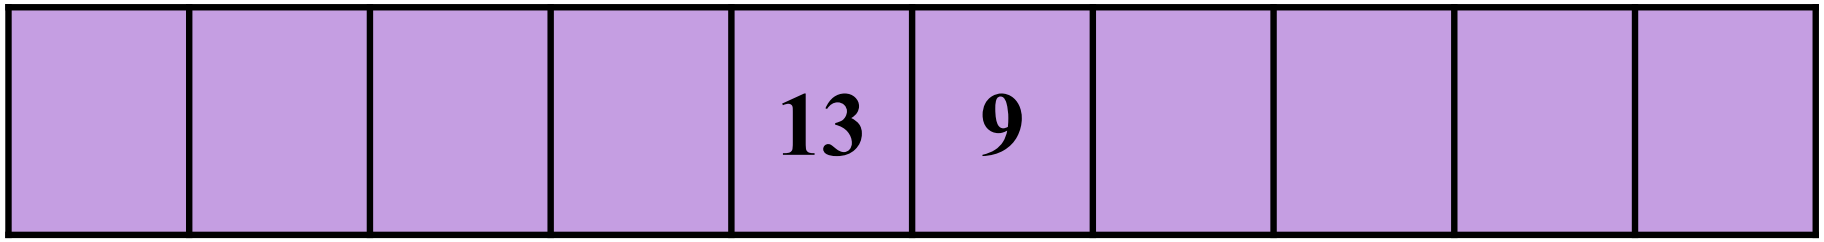
Search for: 5 – 4 = 1 in right half



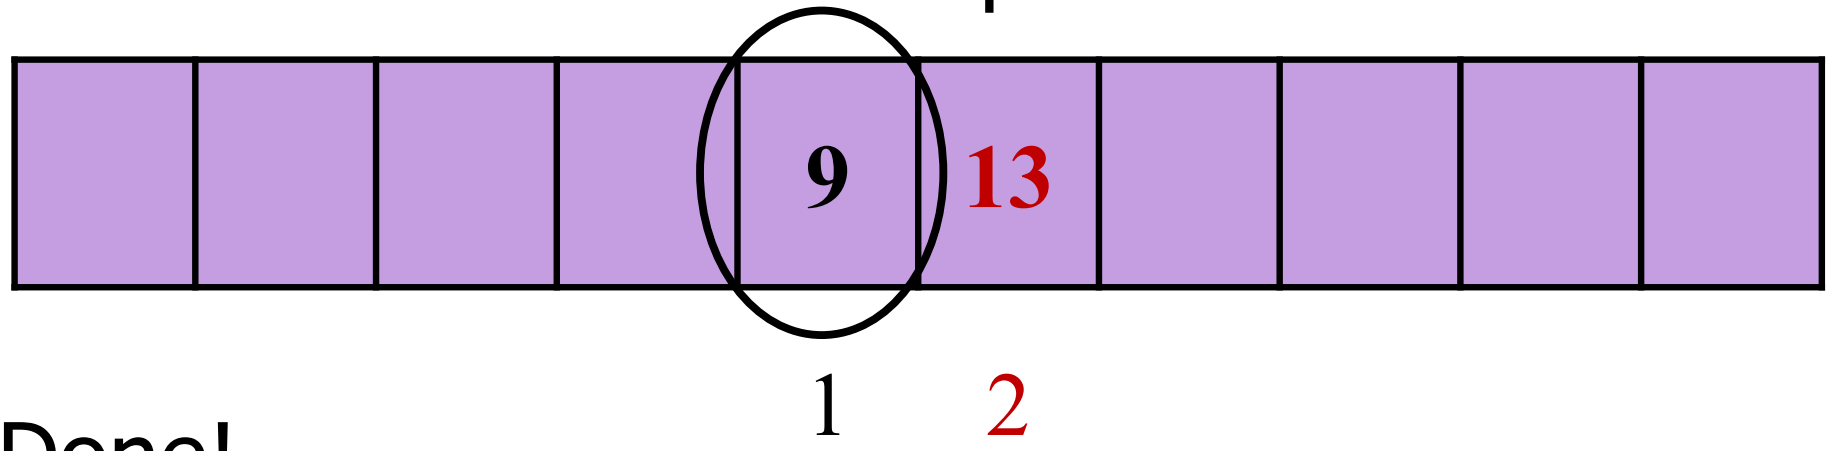
1 2 3 **4** 5 6

Order Statistics

Search for: 5 – 4 = 1 in right half



Partition around random pivot: 13



Done!

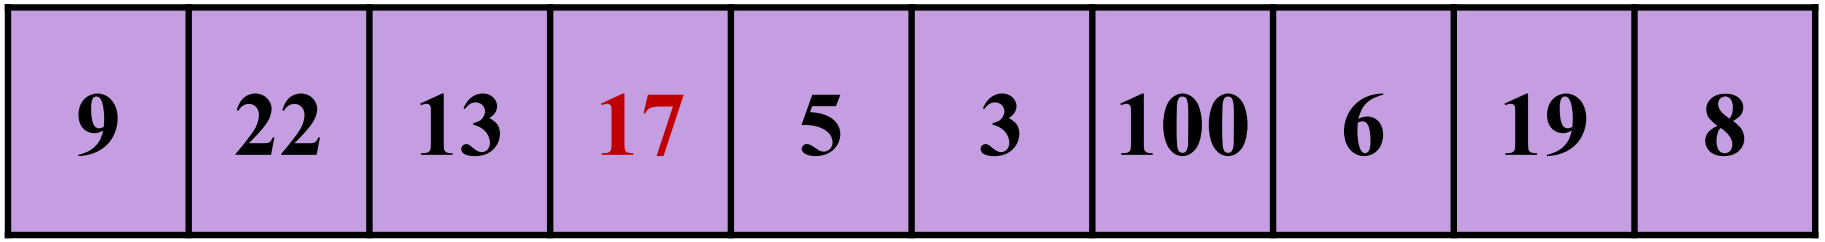
Finding the k^{th} smallest element

```
Select(A[1..n], n, k)
    if (n == 1) then return A[1];
    else   Choose random pivot index pIndex.
           p = partition(A[1..n], n, pIndex)
           if (k == p) then return A[p];
           else if (k < p) then
                  return Select(A[1..p–1], k)
           else if (k > p) then
                  return Select(A[p+1], k – p)
```

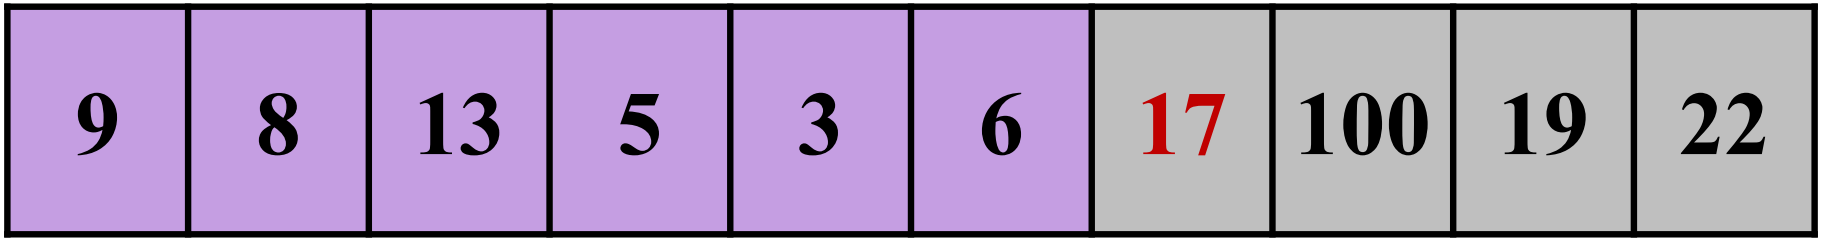
Order Statistics

Recursing right and left are not exactly the same.

Example: search for 5th element



Partition around random pivot: 17



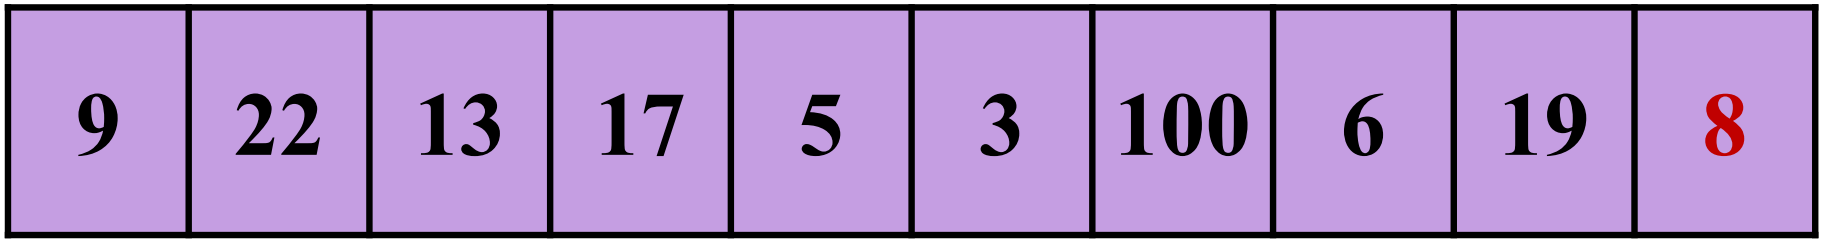
1 2 3 4 5 6 7 8 9 10

Search for 5th element on the left.

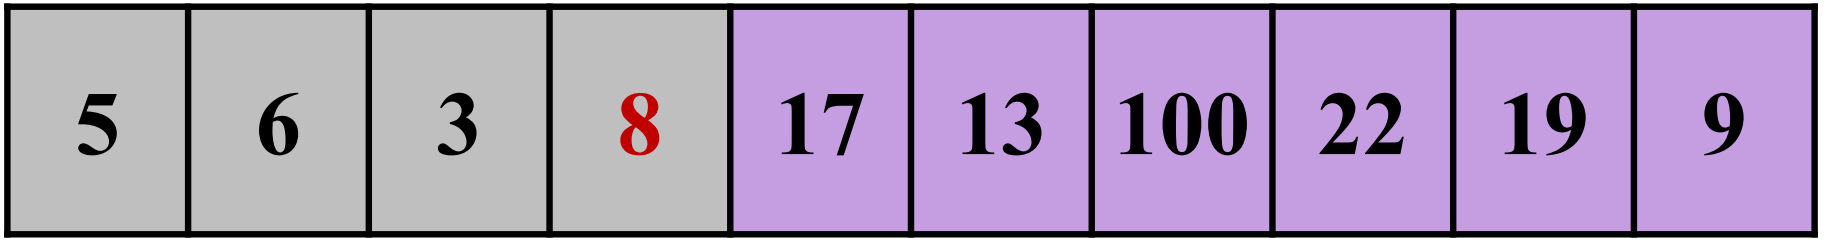
Order Statistics

Recursing right and left are not exactly the same.

Example: search for 8th element



Partition around random pivot: 8



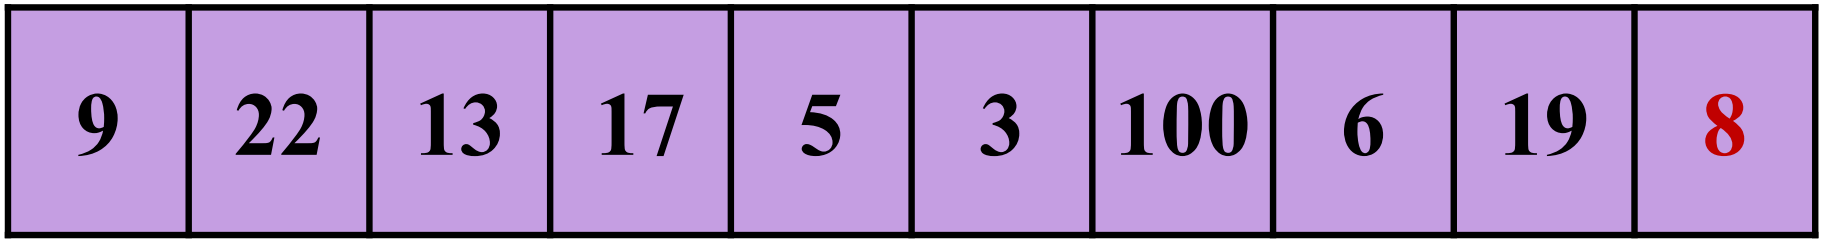
1 2 3 4 5 6 7 8 9 10

Search for 4th element on the right.

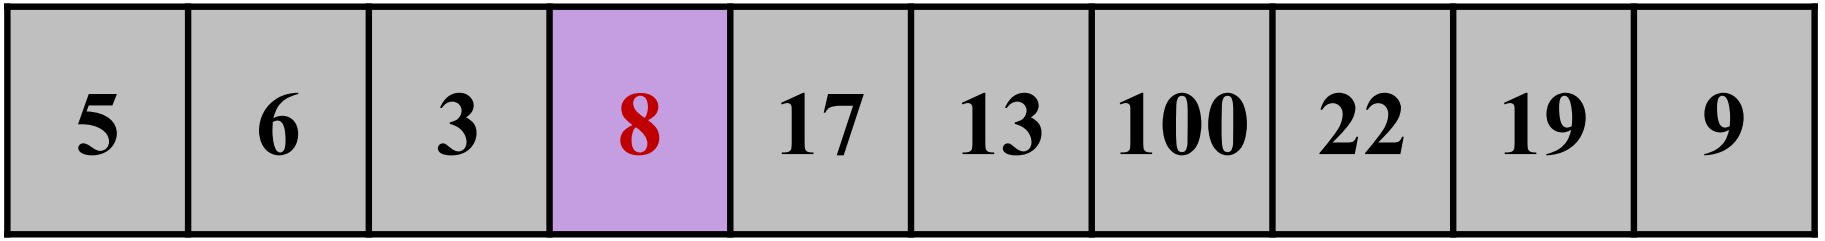
Order Statistics

Recursing right and left are not exactly the same.

Example: search for 4th element



Partition around random pivot: 8



1 2 3 4 5 6 7 8 9 10

Return 8.

Finding the k^{th} smallest element

```
Select(A[1..n], n, k)
    if (n == 1) then return A[1];
    else   Choose random pivot index pIndex.
           p = partition(A[1..n], n, pIndex)
           if (k == p) then return A[p];
           else if (k < p) then
                  return Select(A[1..p–1], k)
           else if (k > p) then
                  return Select(A[p+1], k – p)
```

Finding the k^{th} smallest element

Key point:

- Only recurse *once*!

- Why not recurse twice?
  - Does not help---the correct element is on one side.
  - You do not need to sort both sides!
  - Makes it run a lot faster.
  - If you recurse on both sides, you are sorting!

Analysis

Paranoid-Select:

Repeatedly partition until at least $n/10$ in each half of the partition.

```
repeat
        p = partition(A[1..n], n, pIndex)
until (p > n/10) and (p < 9n/10)
```

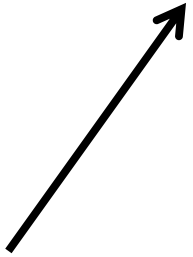
Analysis

Paranoid-Select:

Repeatedly partition until at least $n/10$ in each half of the partition.

Recurrence:

$$\mathbf{E}[T(n)] \leq \mathbf{E}[T(9n/10)] + \mathbf{E}[\#\text{ partitions}](n)$$



cost of partitioning

Analysis

Paranoid-Select:

Repeatedly partition until at least $n/10$ in each half of the partition.

Recurrence:

$$\mathbf{E}[\mathrm{T}(n)] \leq \mathbf{E}[\mathrm{T}(9n/10)] + \mathbf{E}[\#\ \text{partitions}](n)$$
$$\leq \mathbf{E}[\mathrm{T}(9n/10)] + 2n$$

Recurrence

What is the solution to the following recurrence?

$$T(n) \leq T(9n/10) + 2n$$

Recurrence

What is the solution to the following recurrence?

$$T(n) \leq T(9n/10) + 2n$$

$$= O(n)$$

Analysis

Paranoid-Select:

Repeatedly partition until at least $n/10$ in each half of the partition.

Recurrence:

$$\begin{aligned}
\mathbf{E}[T(n)] &\le \mathbf{E}[\#\text{ partitions}](n) + \mathbf{E}[T(9n/10)] \\
&\le 2n + \mathbf{E}[T(9n/10)] \\
&\le 2n + 2n\,(9/10) + (9/10)\,\mathbf{E}[T(9n/10)] \\
&\le 2n + 2n\,(9/10) + 2n\,(9/10)^2 + \ldots\ldots
\end{aligned}$$

Analysis

Paranoid-Select:

Repeatedly partition until at least $n/10$ in each half of the partition.

Recurrence:

$$\begin{aligned}\mathbf{E}[\mathrm{T}(n)] &\le \mathbf{E}[\mathrm{T}(9n/10)] + \mathbf{E}[\#\text{ partitions}](n)\\ &\le \mathbf{E}[\mathrm{T}(9n/10)] + 2n\\ &\le \mathrm{O}(n)\end{aligned}$$

Recurrence: $T(n) = T(n/c) + O(n)$

Summary

QuickSort: O(n log n)

- Partitioning an array
- Deterministic QuickSort
- Paranoid Quicksort

Order Statistics: O(n)

- Finding the k^{th} smallest element in an array.
- Key idea: partition
- Paranoid Select

Plan of the Day

Trees

- Terminology
- Traversals
- Operations

Balanced Trees

- Height-balanced binary search trees
- AVL trees
- Rotations

Dictionary Interface

A collection of (key, value) pairs:

interface	**IDictionary**	
void	insert(Key k, Value v)	*insert (k,v) into table*
Value	search(Key k)	*get value paired with k*
Key	successor(Key k)	*find next key > k*
Key	predecessor(Key k)	*find next key < k*
void	delete(Key k)	*remove key k (and value)*
boolean	contains(Key k)	*is there a value for k?*
int	size()	*number of (k,v) pairs*

Dictionary

Implementation

Option 1: Sorted array

- insert : ?
- search : ?

Option 2: Unsorted array

- insert : ?
- search : ?

Option 3: Linked list

- insert : ?
- search : ?

Dictionary

Implementation

Option 1: Sorted array

- insert : add to middle of array ➔ O(n)
- search : binary search ➔ O(log n)

Option 2: Unsorted array

- insert : add to end of array ➔ O(1)
- search : unsorted ➔ O(n)

Option 3: Linked list

- insert : add to head of list ➔ O(1)
- search : list traversal ➔ O(n)

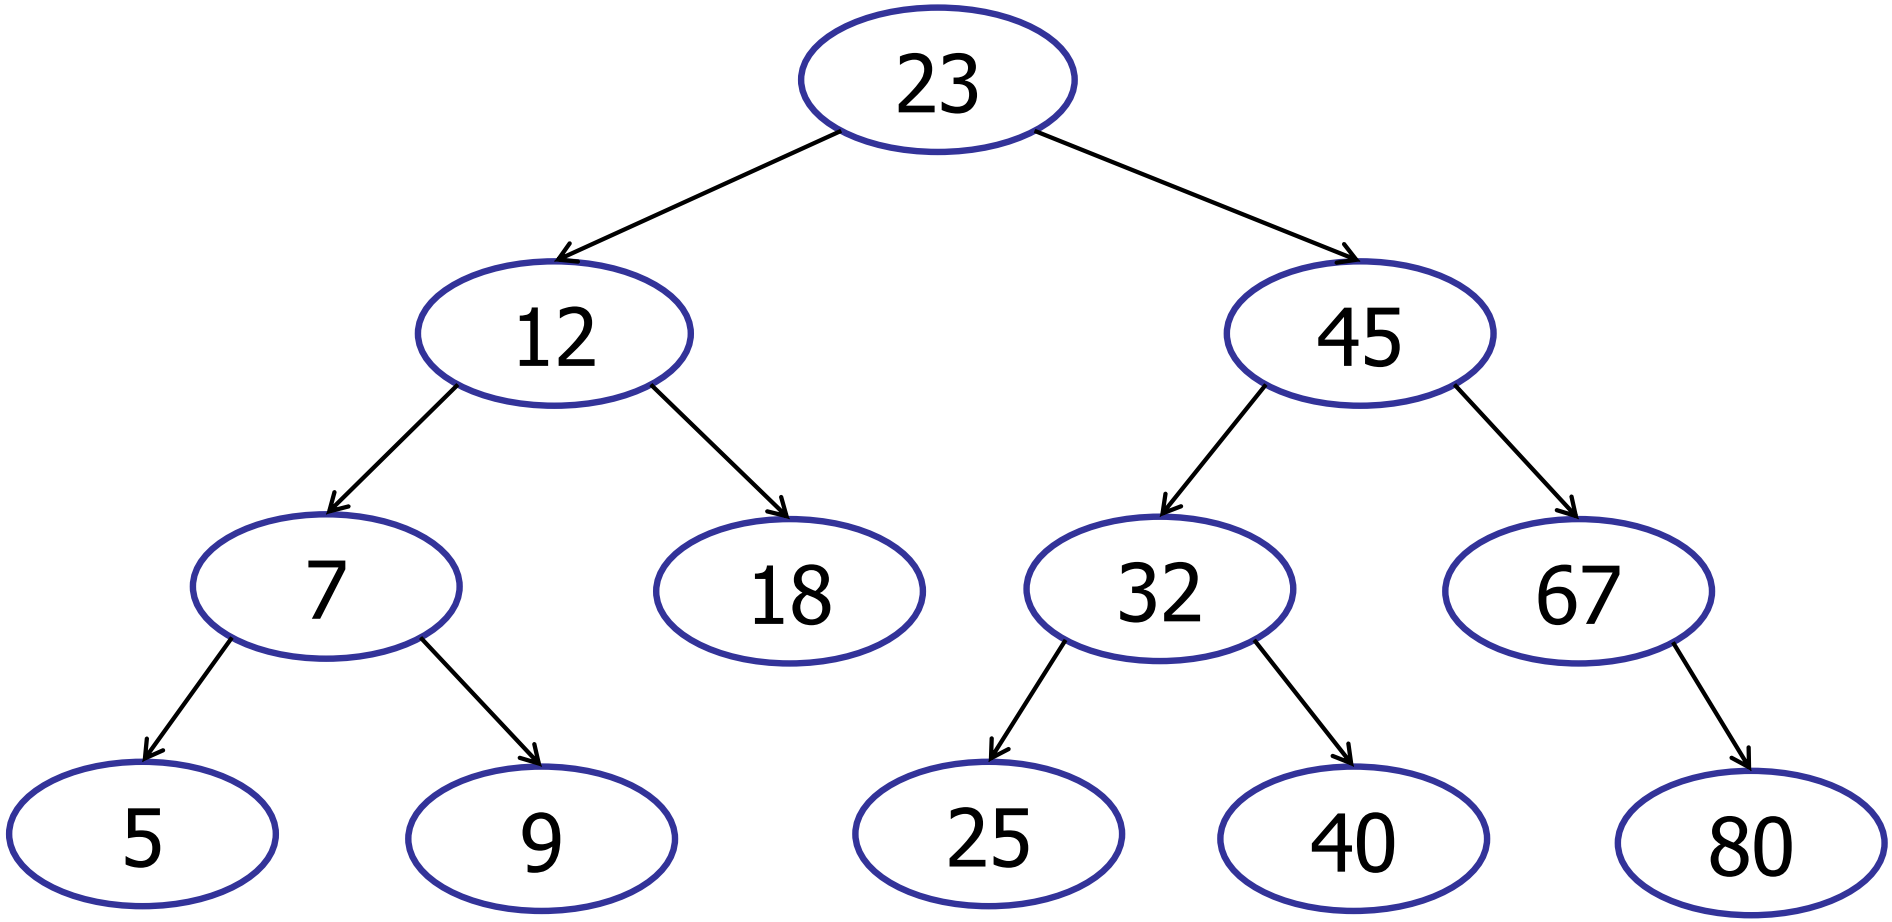
Dictionary Implementation

Possible Choices:

- Implement using an array
- Implement using a Java library (see: java.util.Vector or java.util.ArrayList).
- Implement using a queue.
- Implement using a linked list
- …

Dictionary

Implementation idea: Tree

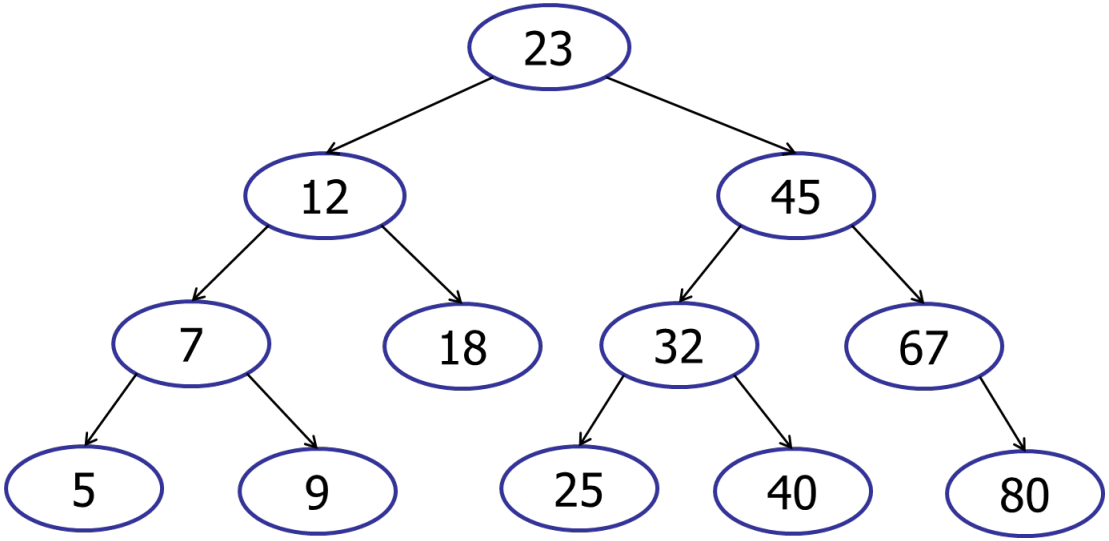


Dictionary

Implementation idea: Tree

Critical Components:

- Nodes
- Edges directed from one node to another.
- Root (?)
- No cycles



Binary Tree

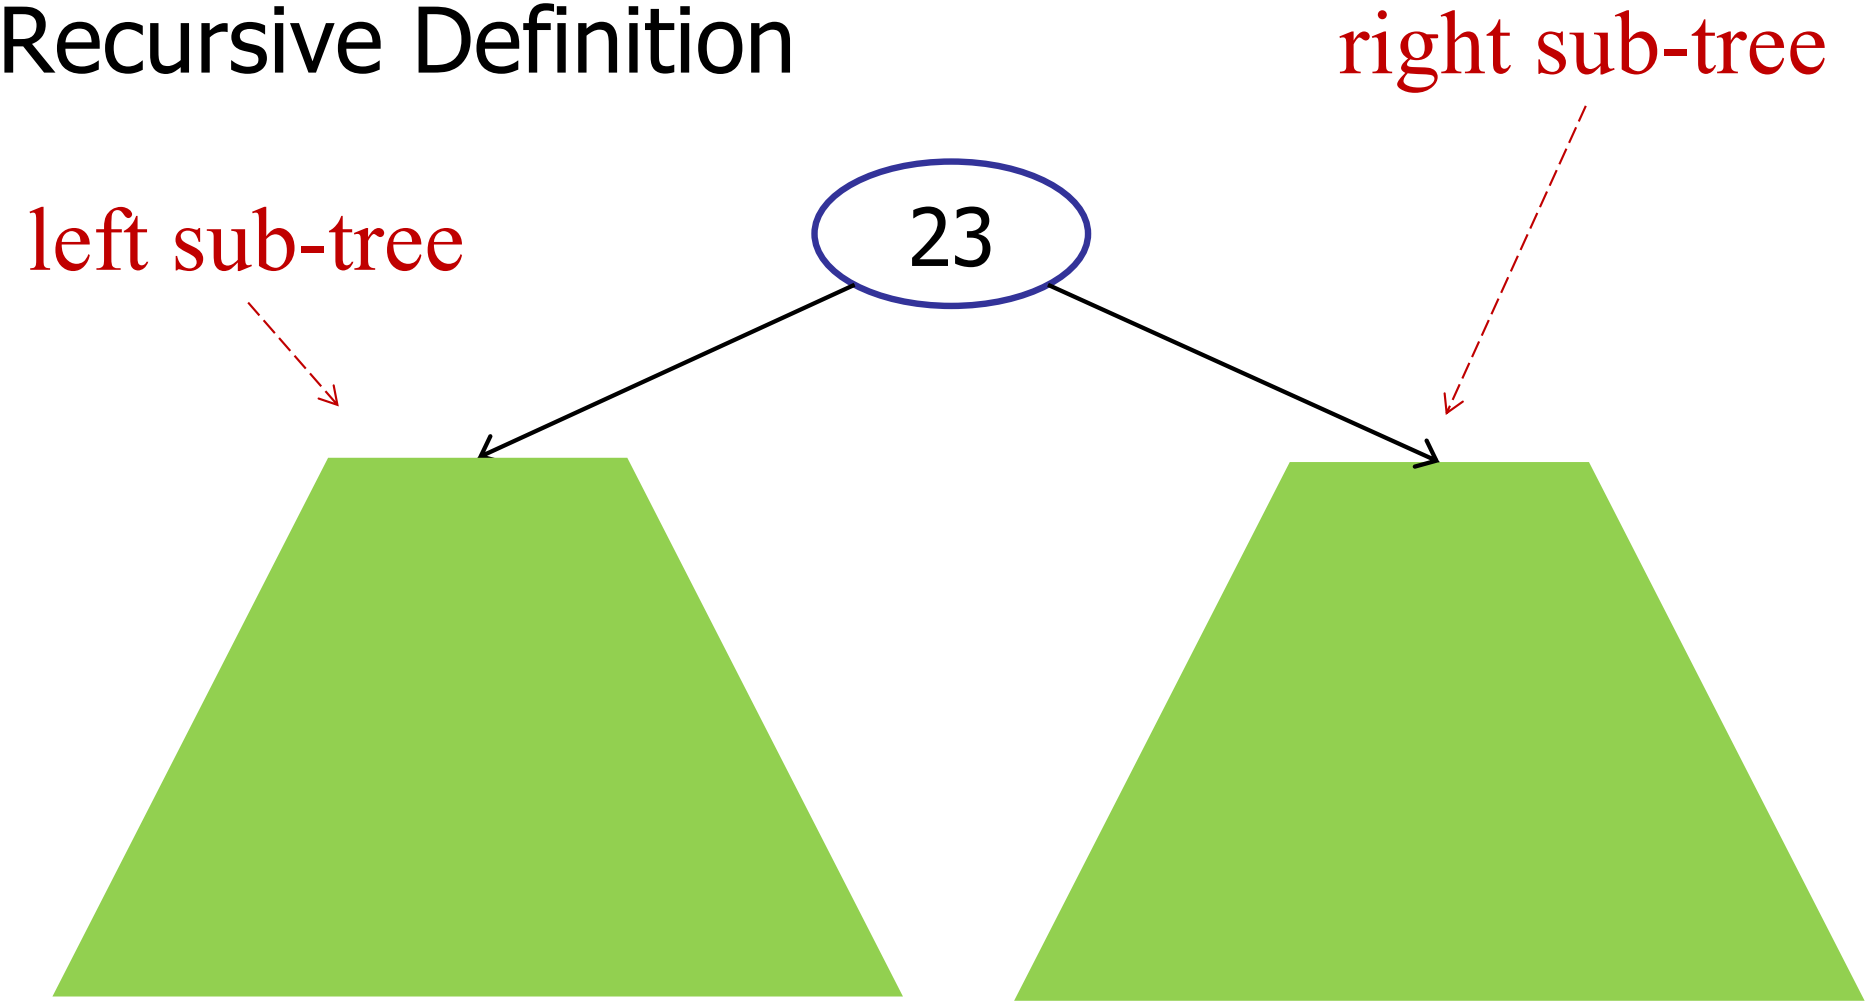
Recursive Definition



A binary tree is either: **(a) empty**
(b) a node pointing to two binary trees

Binary Tree

Java??

```
public class BinaryTree {

        private BinaryTree leftTree;
        private BinaryTree rightTree;

        private KeyType key;
        private ValueType value;

        // Remainder of binary tree implementation
}
```

Binary Tree

Java??

```
public class TreeNode {

        private TreeNode leftTree;
        private TreeNode rightTree;

        private KeyType key;
        private ValueType value;

        // Remainder of binary tree implementation
}
```

Binary Tree

Java??

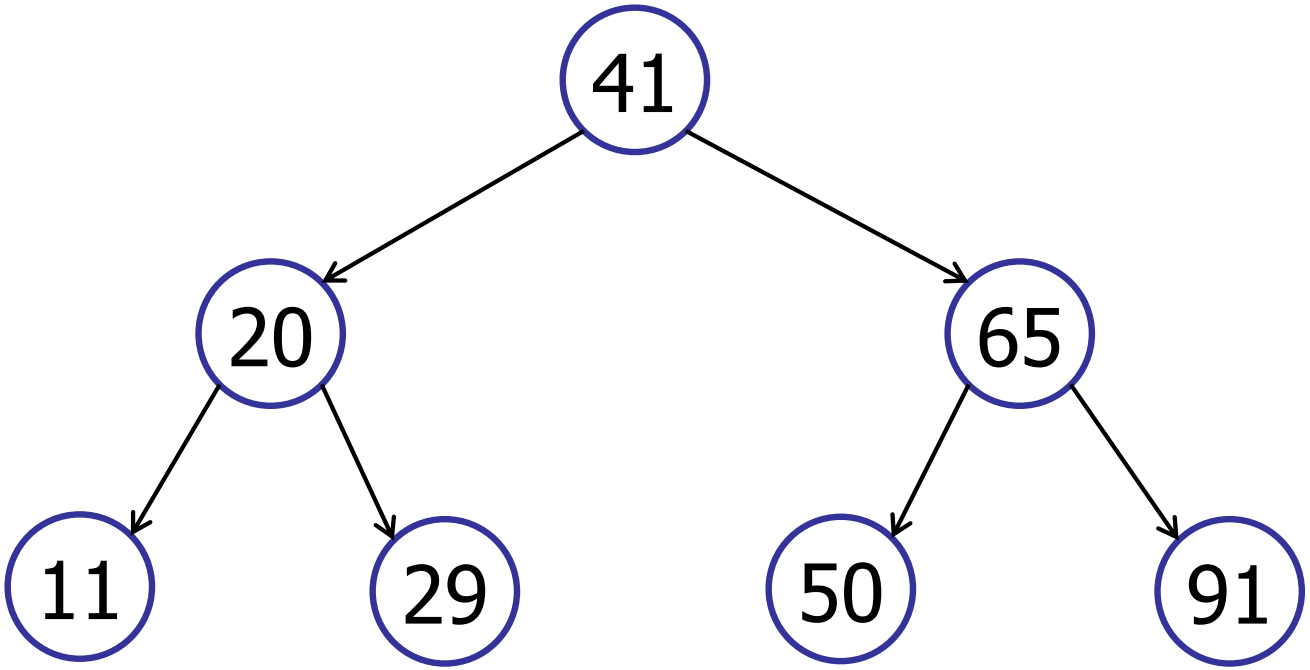
```
public class BinaryTree {

        private TreeNode leftTree;
        private TreeNode rightTree;

        private int key;
        private int value;

        // Remainder of binary tree implementation
}
```

Binary **Search** Trees (BST)

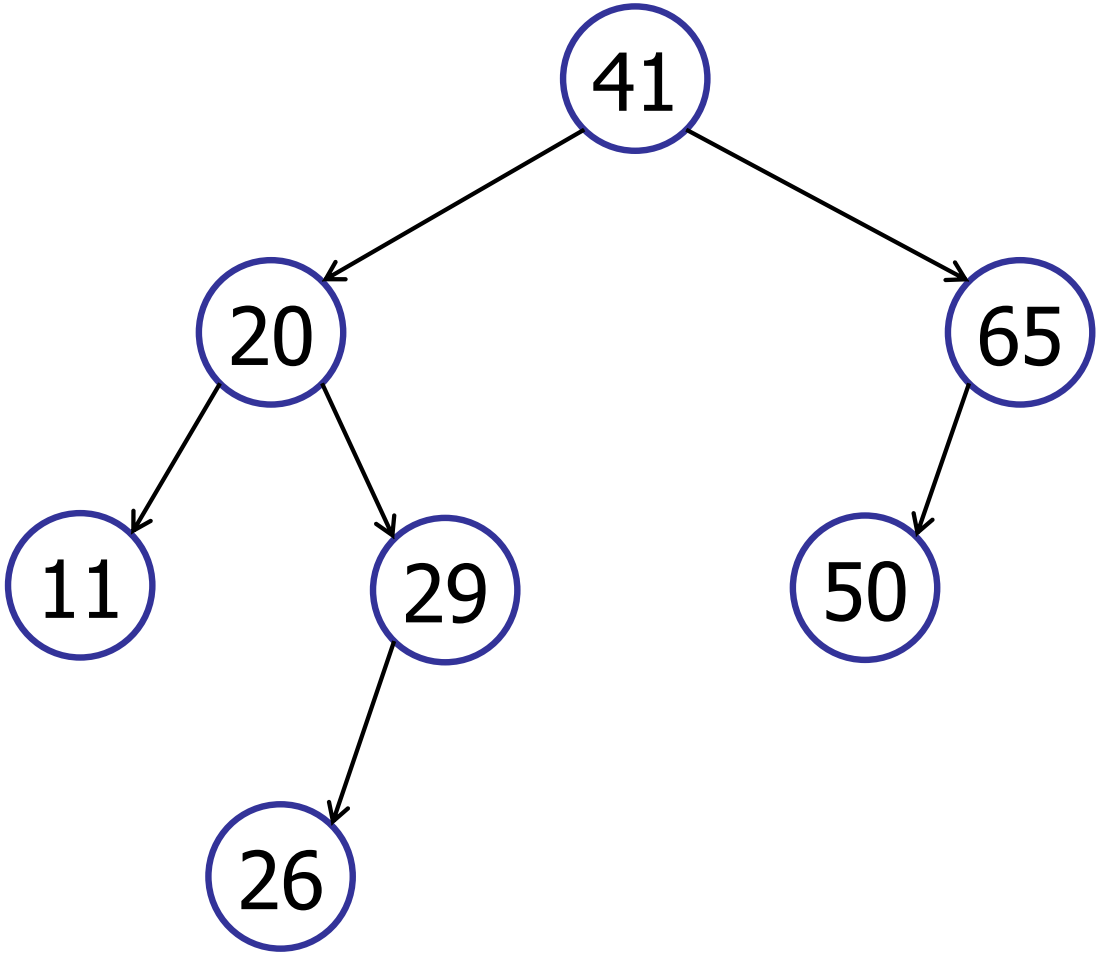


BST Property:

all in left sub-tree < key < all in right sub-right

Is this a binary search tree?

1. Yes
2. No
3. I don't know.



Is this a binary search tree?

1. Yes
2. No
3. I don't know.

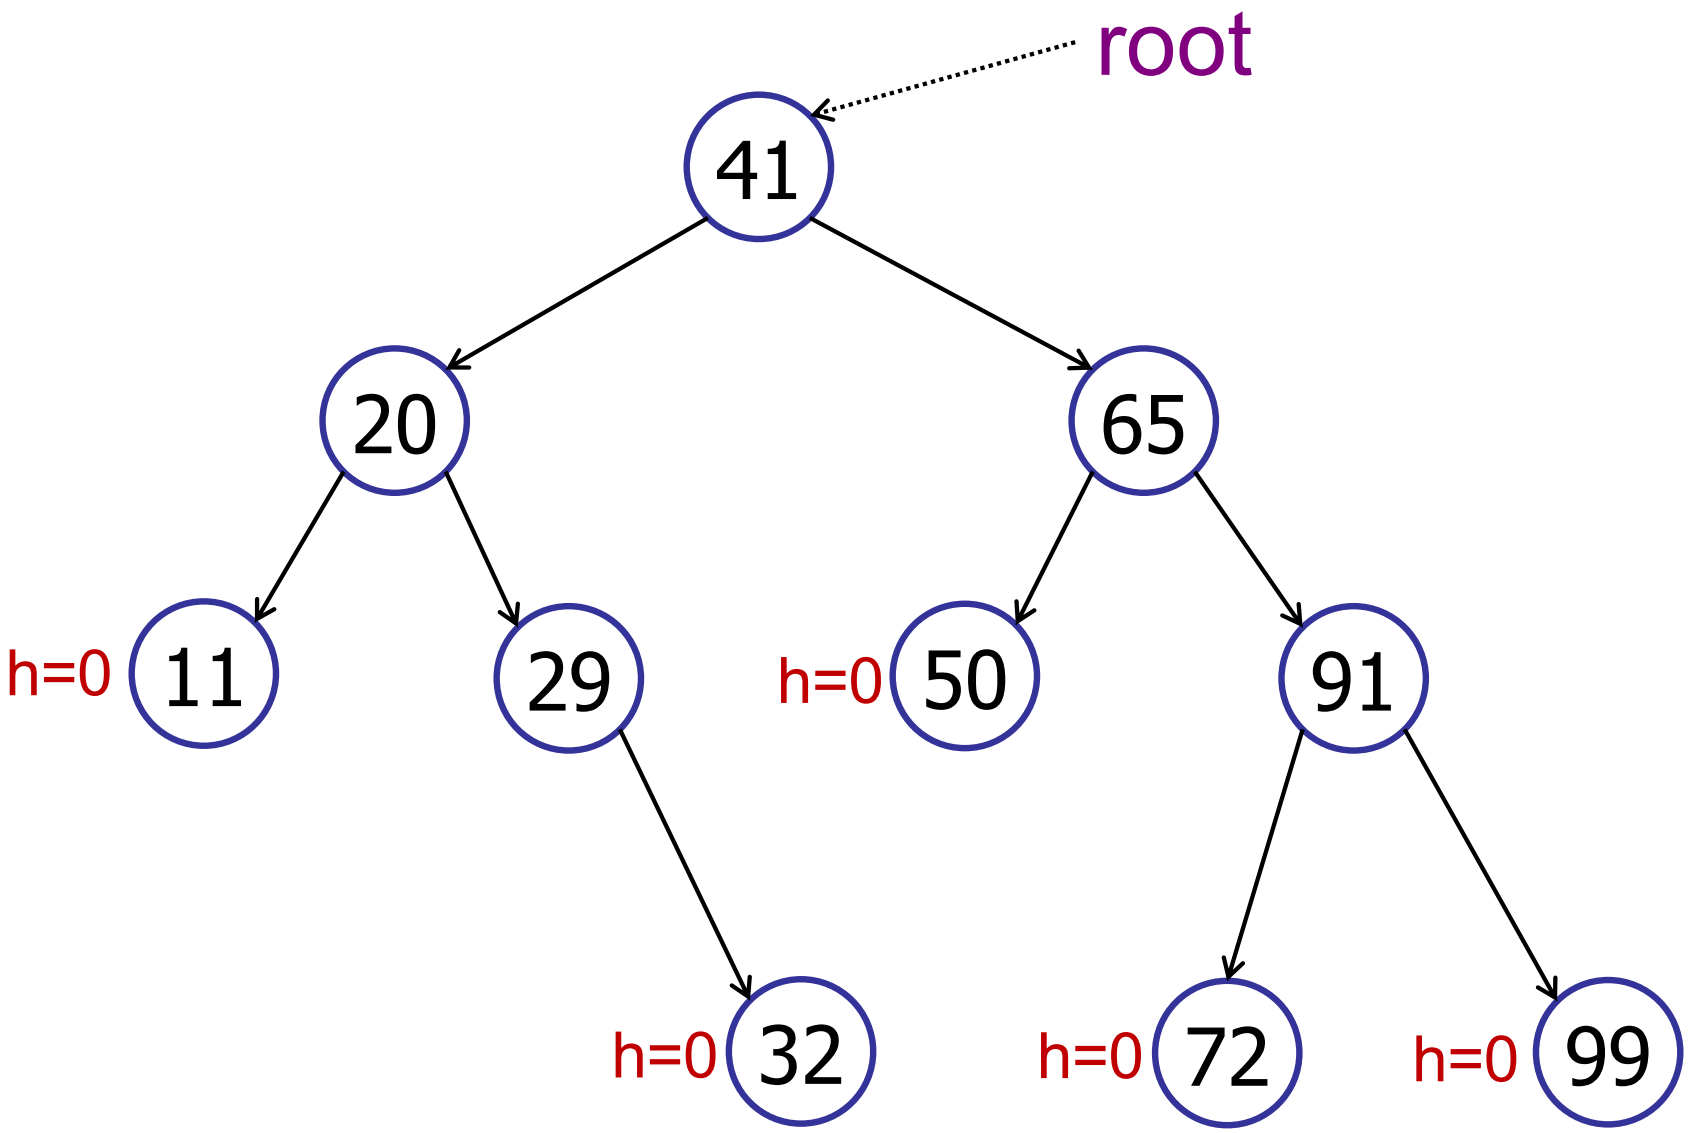
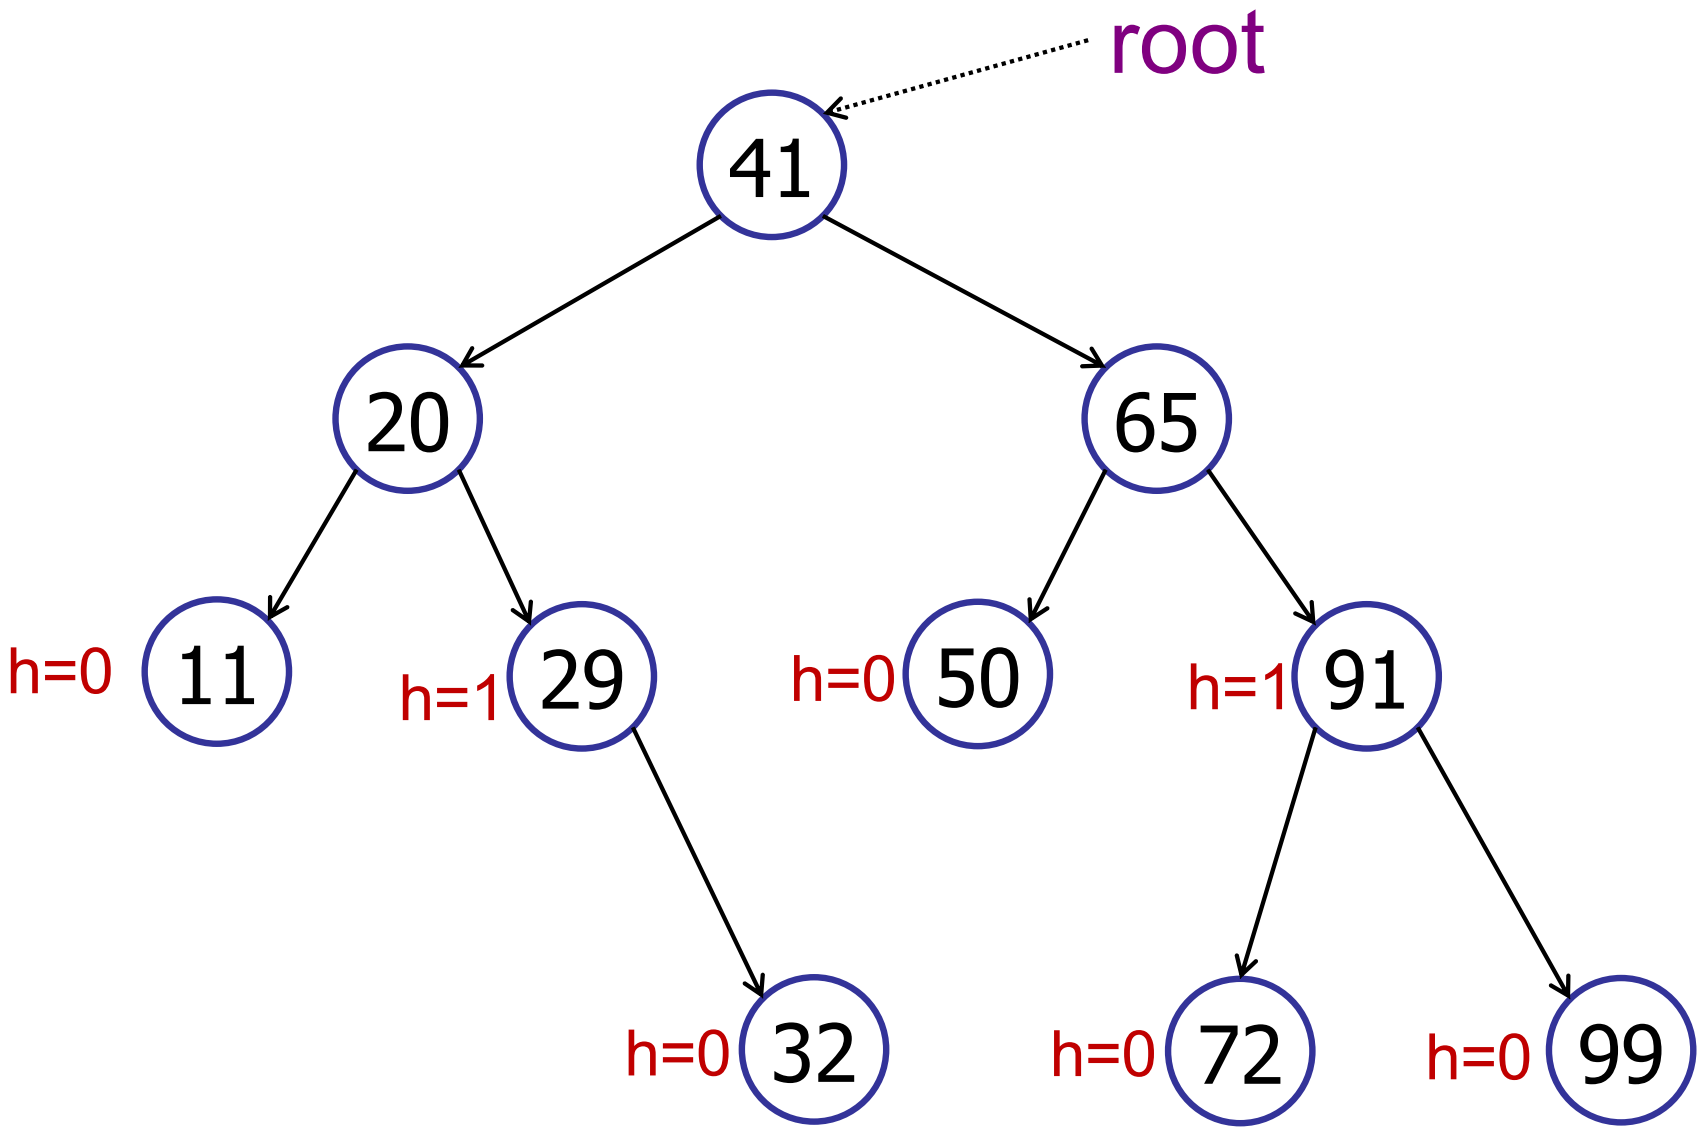
4. Other operations

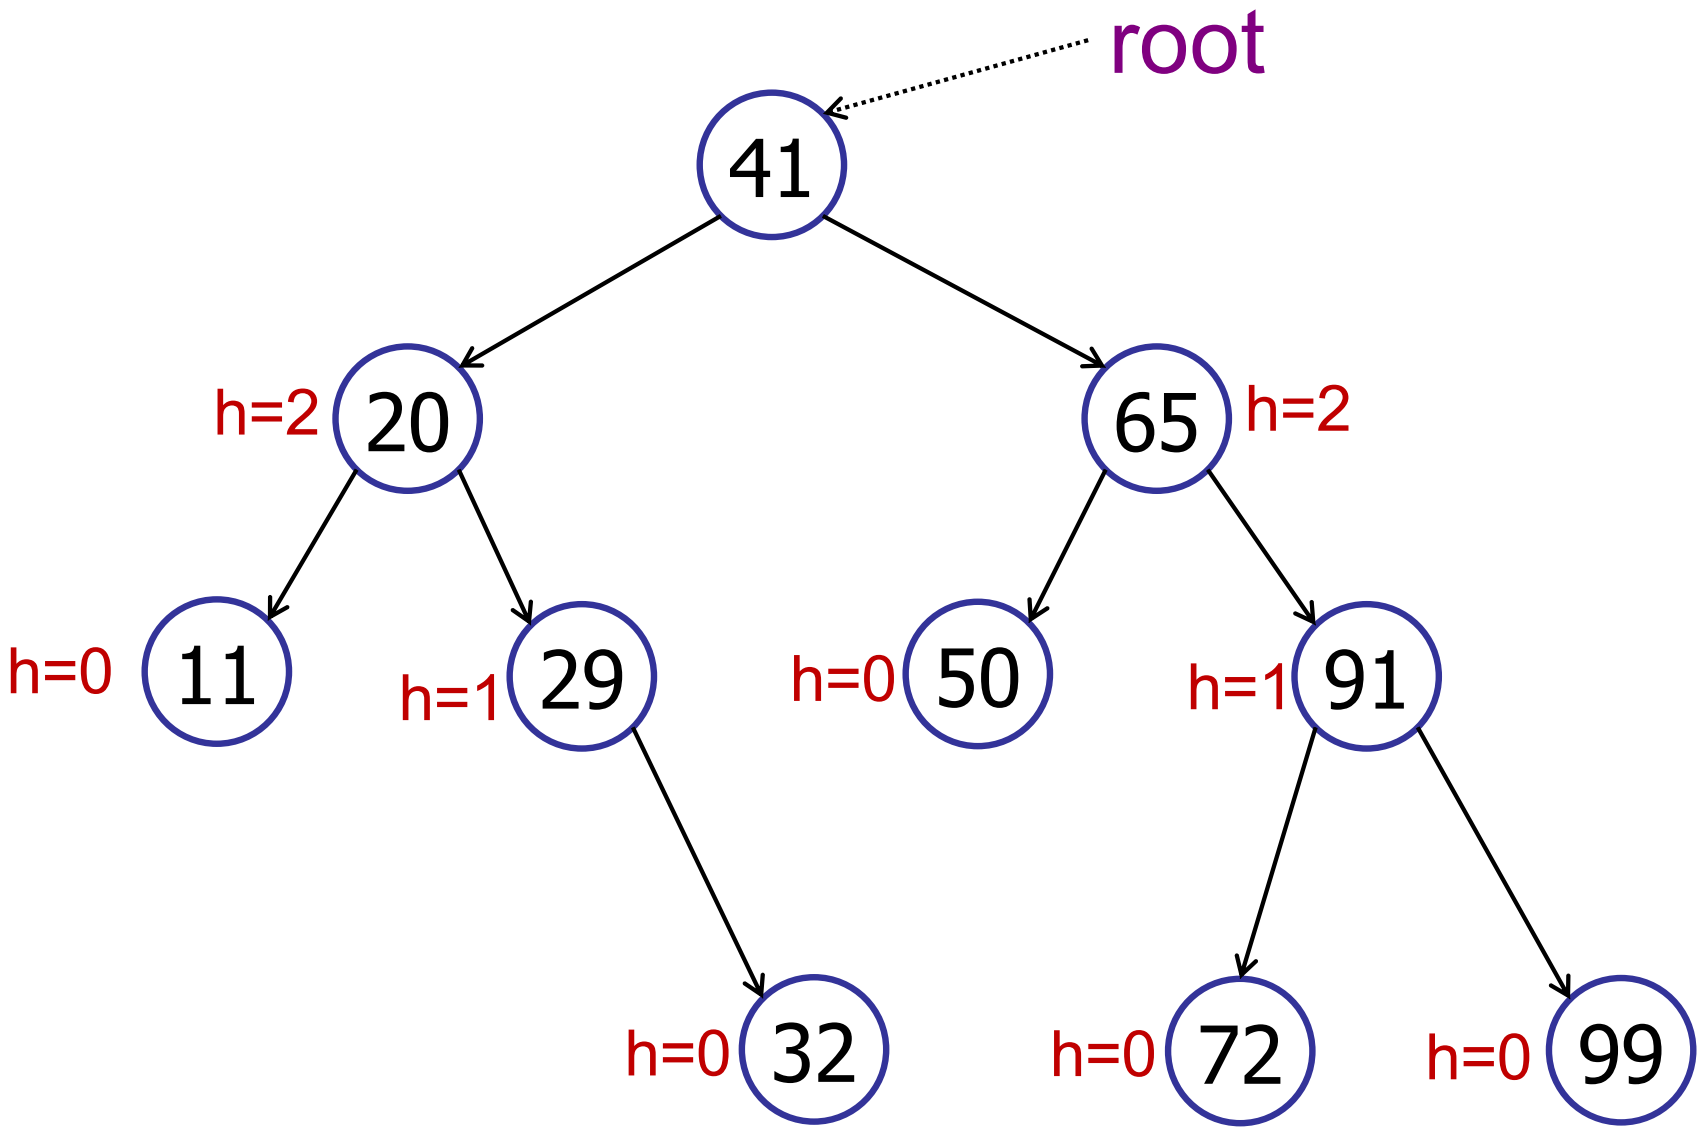
Height of a Binary Tree



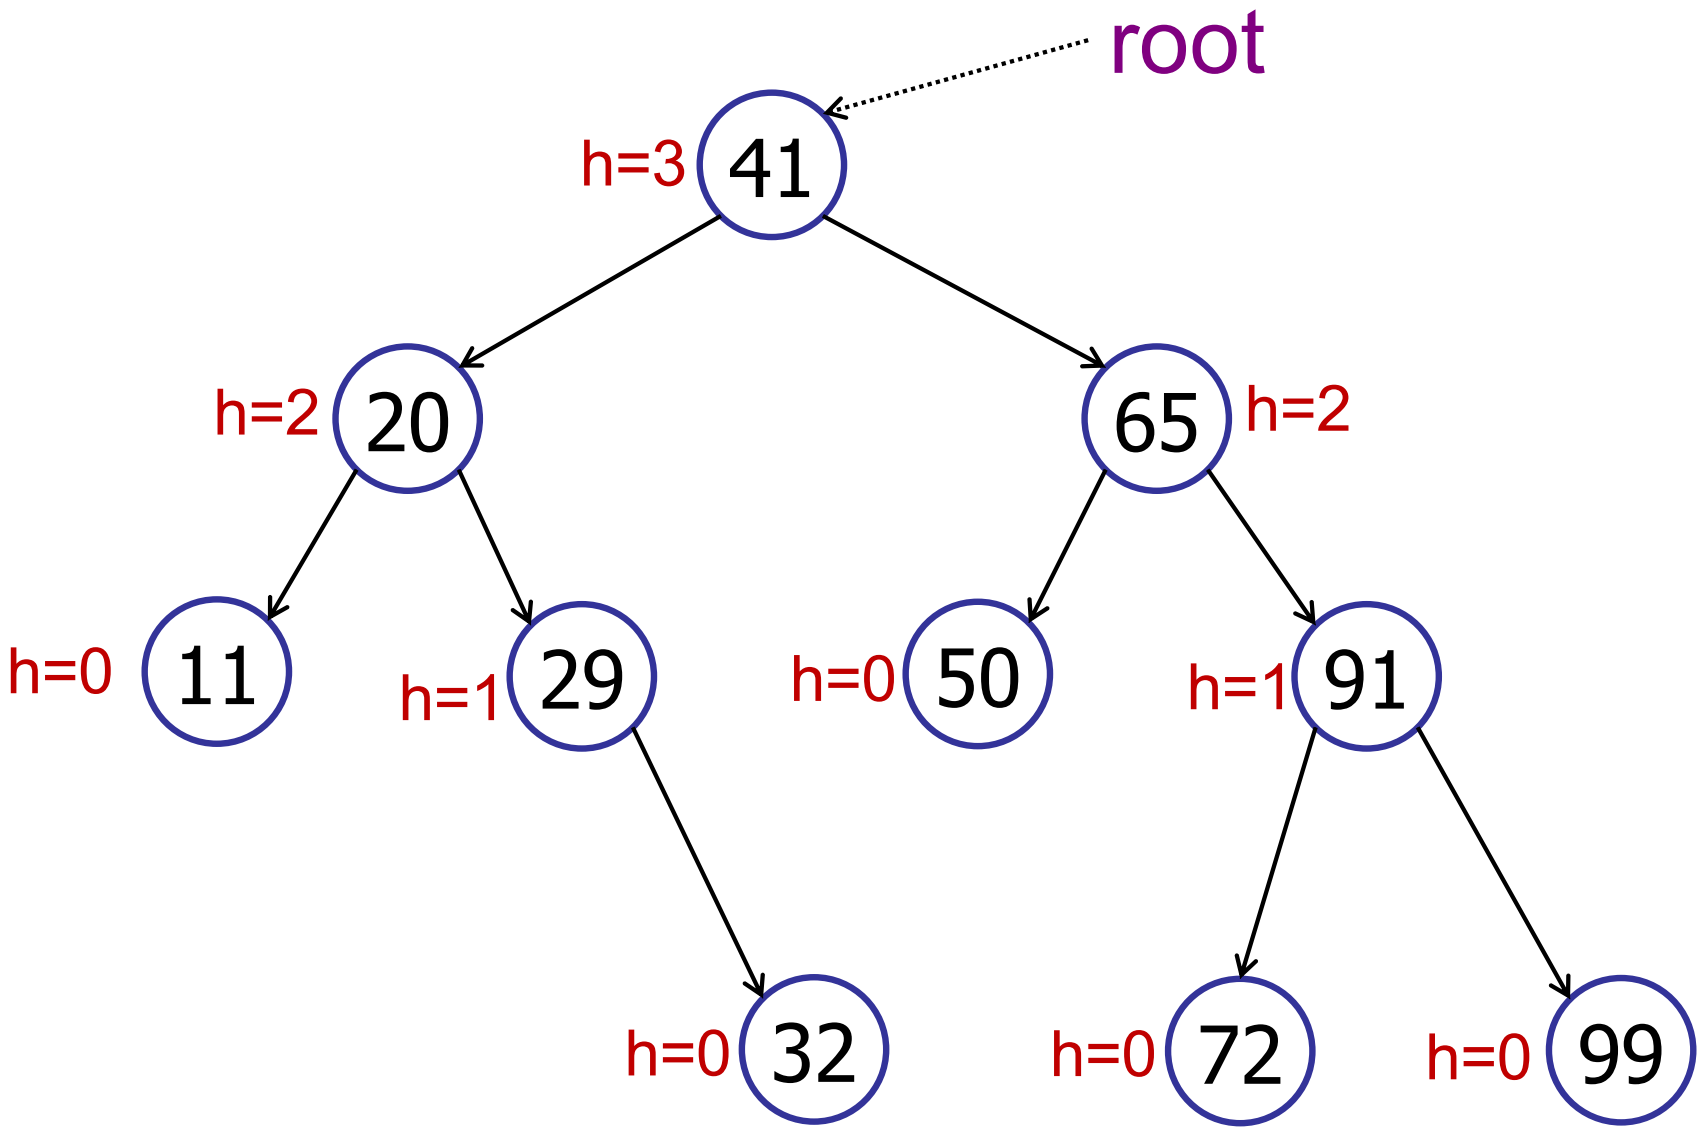
Height of a Binary Tree



Height of a Binary Tree



Height of a Binary Tree



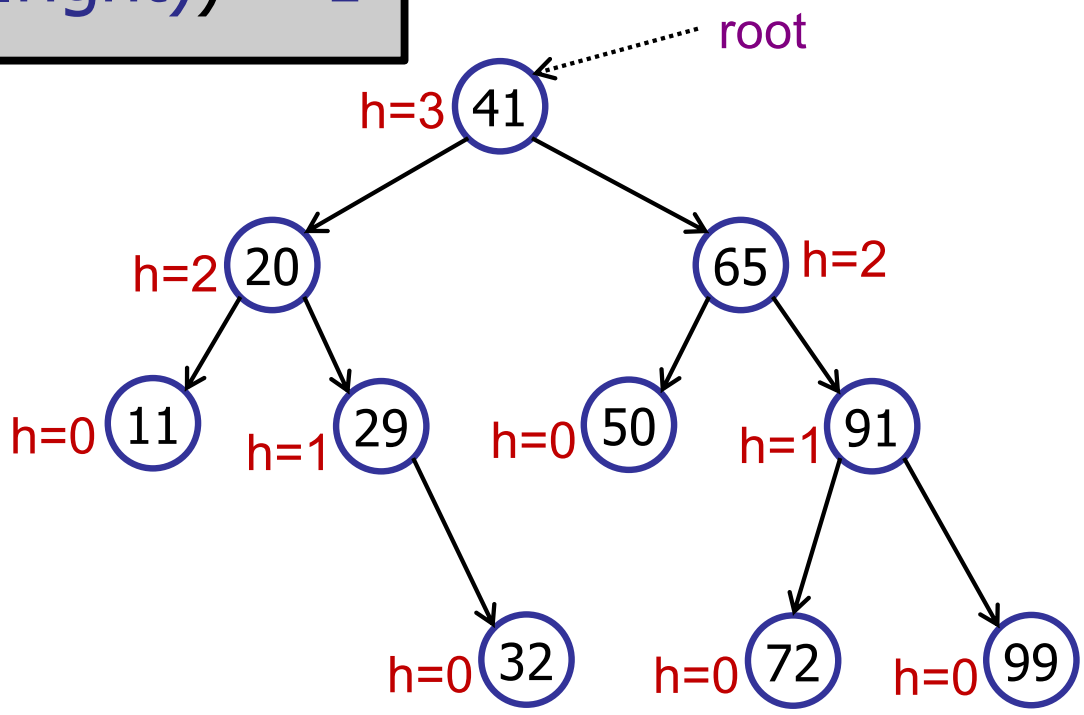
Height of a Binary Tree

Height:

Number of edges on longest path from root to leaf.

$h(v) = 0$ (if v is a leaf)

$h(v) = \max(h(v.left), h(v.right)) + 1$



(For simplicity: h(null) = -1)

Binary Tree

Calculating the heights

check for null

```
public int height(){
        int leftHeight = -1;
        int rightHeight = -1;
        if (leftTree != null)
                leftHeight = leftTree.height();
        if (rightTree != null)
                rightHeight = rightTree.height();
        return max(leftHeight, rightHeight) +  1;
}
```

max of subtrees

add 1

The height of this tree is?

1. 2

post-order-traversal(v)

```
public void post-order-traversal(){
        // Traverse left sub-tree
        if (leftTree != null)
                leftTree.in-order-traversal();

        // Traverse right sub-tree
        if (rightTree != null)
                rightTree.in-order-traversal();

        visit(this);
}
```

Tree Traversals

post-order-traversal

Tree Traversals

Several varieties:

- pre-order
- in-order
- post-order
- level-order

Binary Search Trees

1. Terminology and Definitions

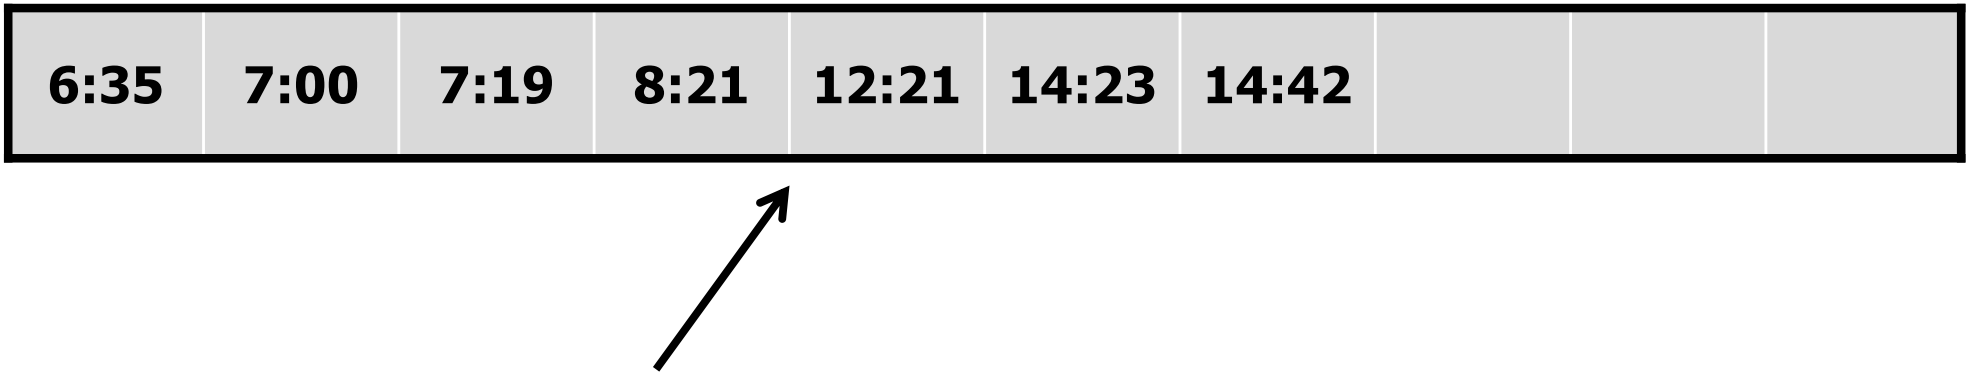
2. Basic operations:
   - height
   - searchMin, searchMax
   - search, insert

3. Traversals
   - in-order, pre-order, post-order

4. Other operations

Airport Scheduling

Dictionary

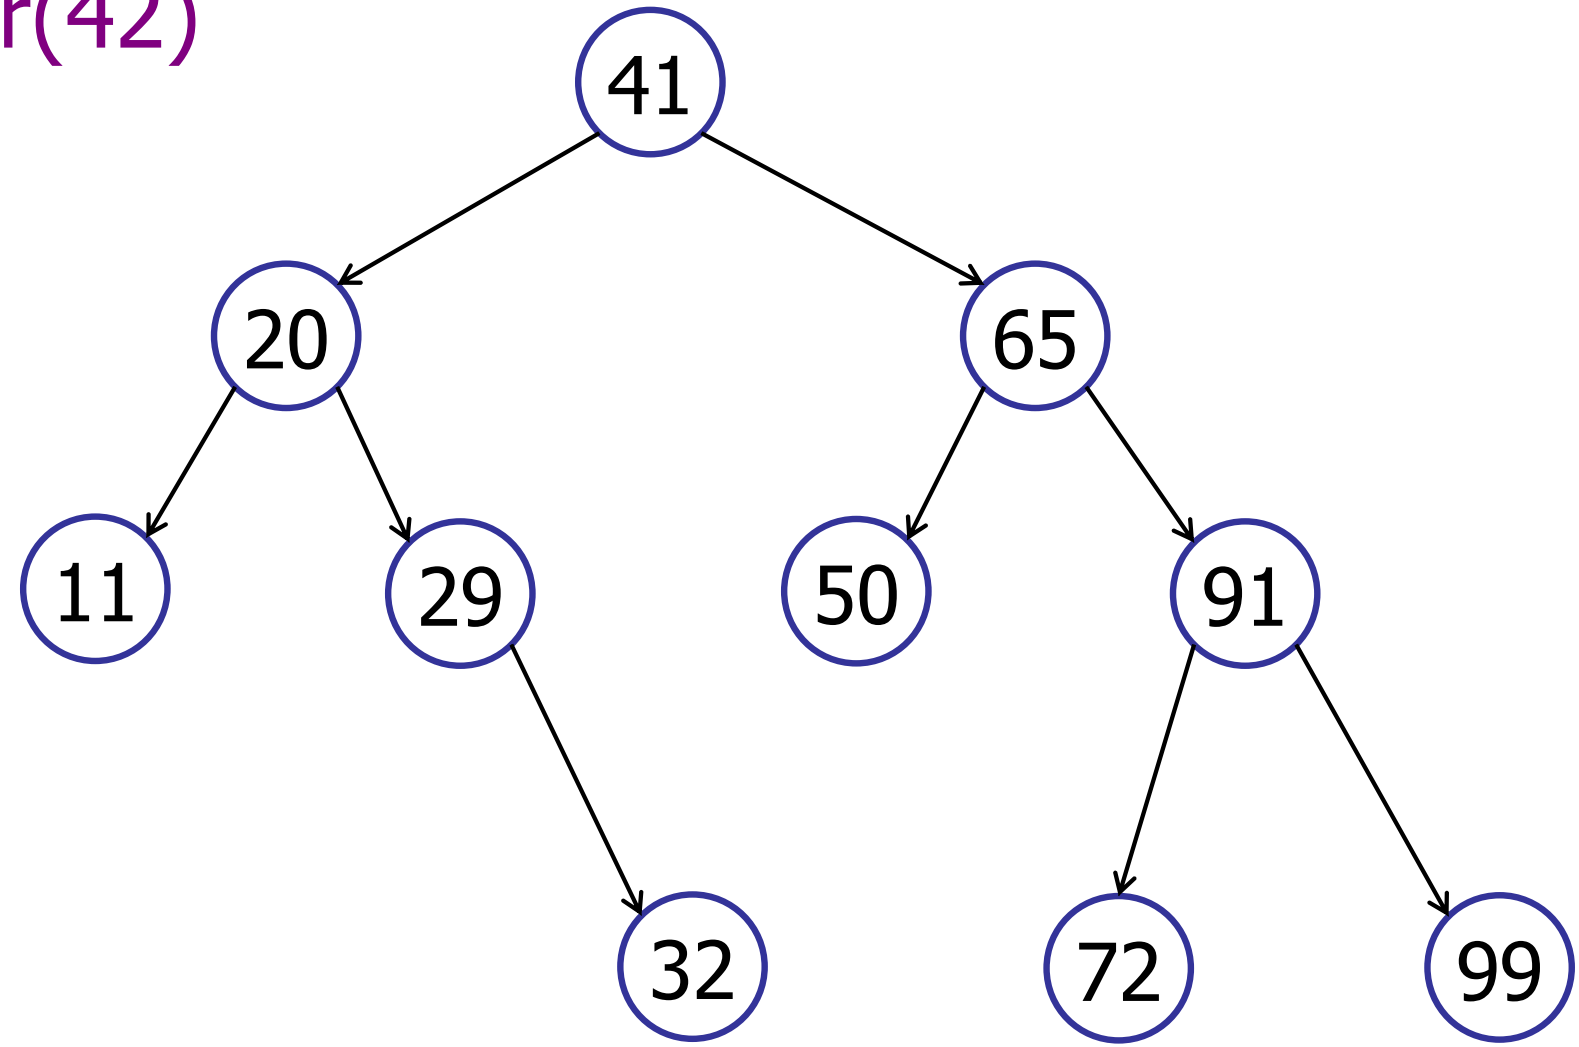


- successor(8:24) = 12:21

How do we implement this?

Successor: Key not in the Tree

successor(42)

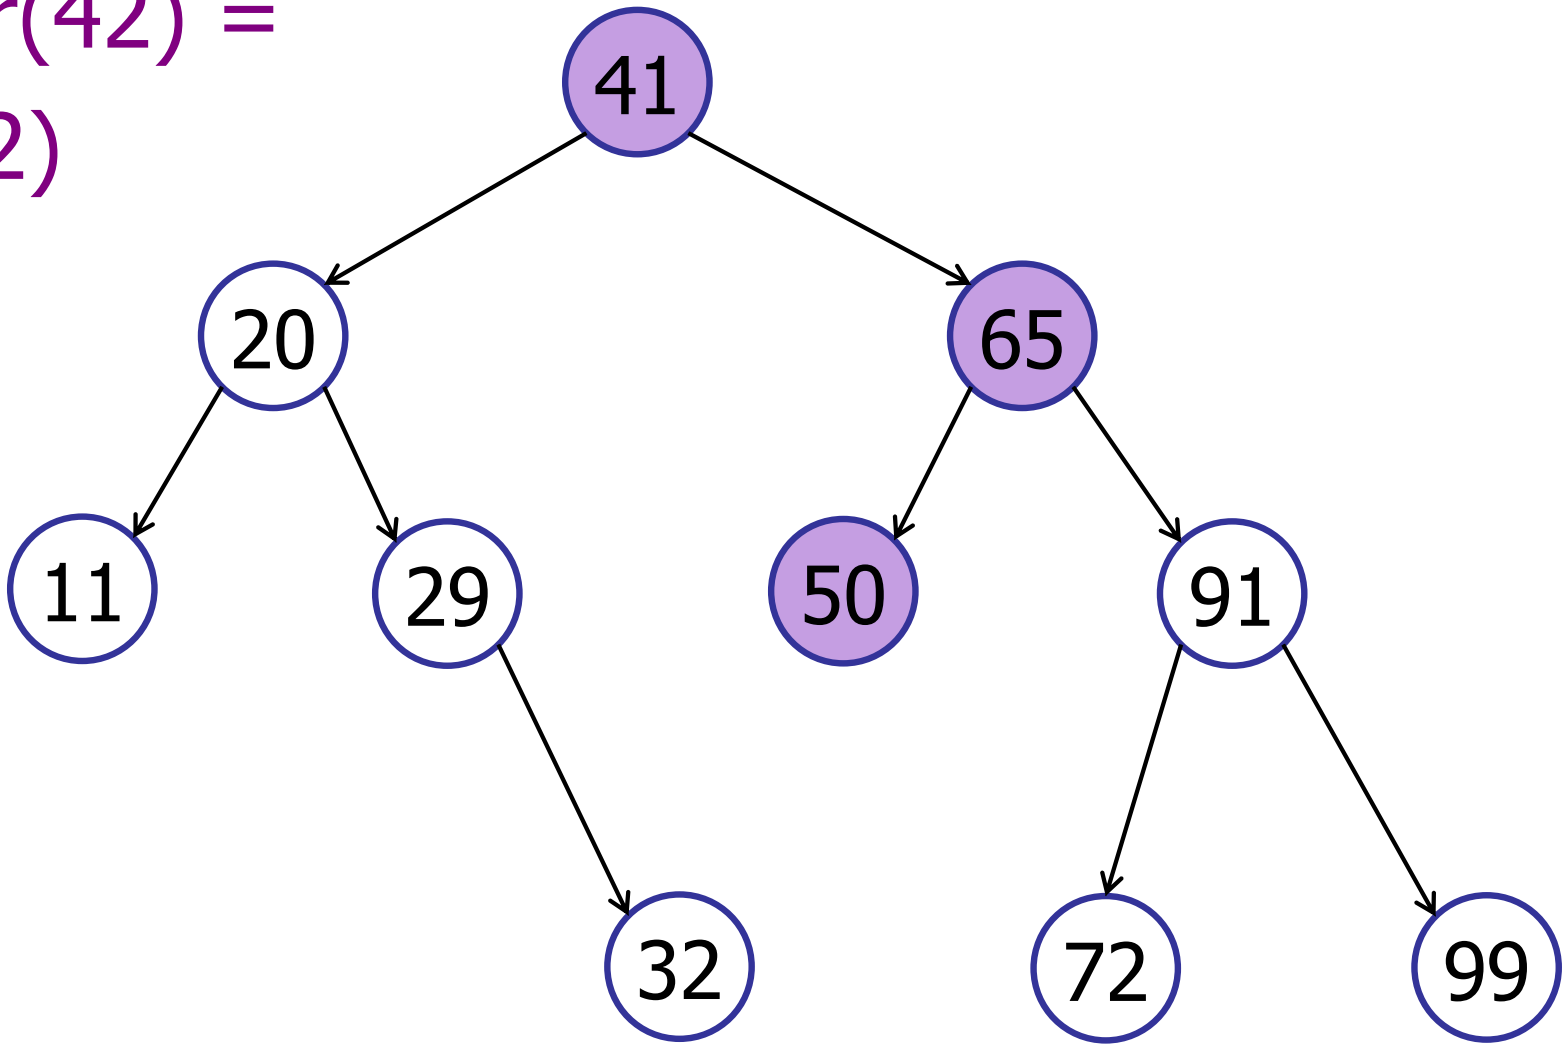


Key 42 is not in the tree

Successor: Key not in the Tree

successor(42) =

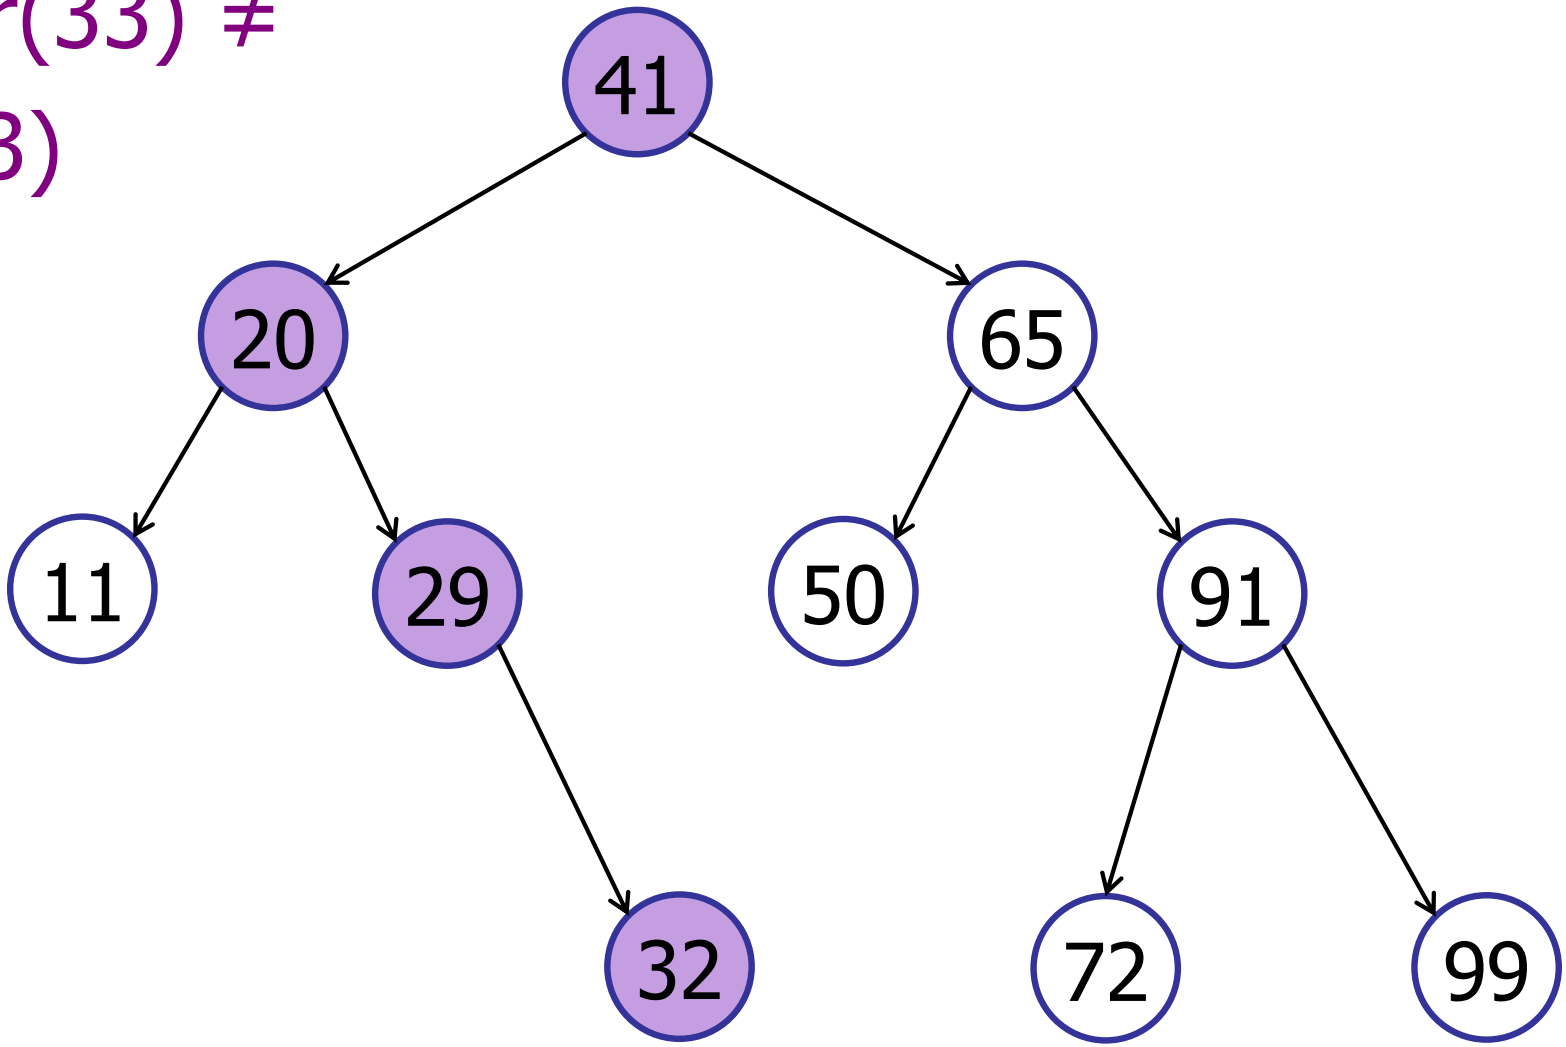
search(42)



Key 42 is not in the tree

Successor: Key not in the Tree

successor(33) ≠
search(33)

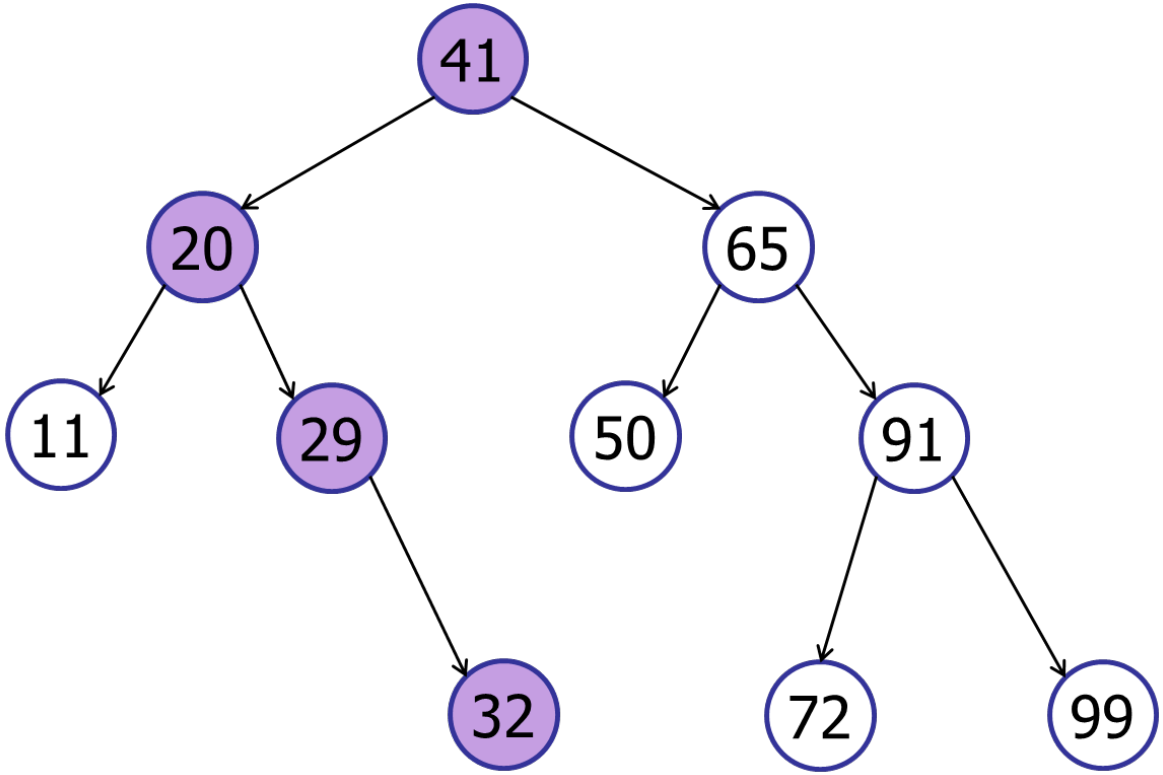


Key 33 is not in the tree

Successor: Key not in the Tree

If you search for a key not in the tree:

➔ either find predecessor
or successor.



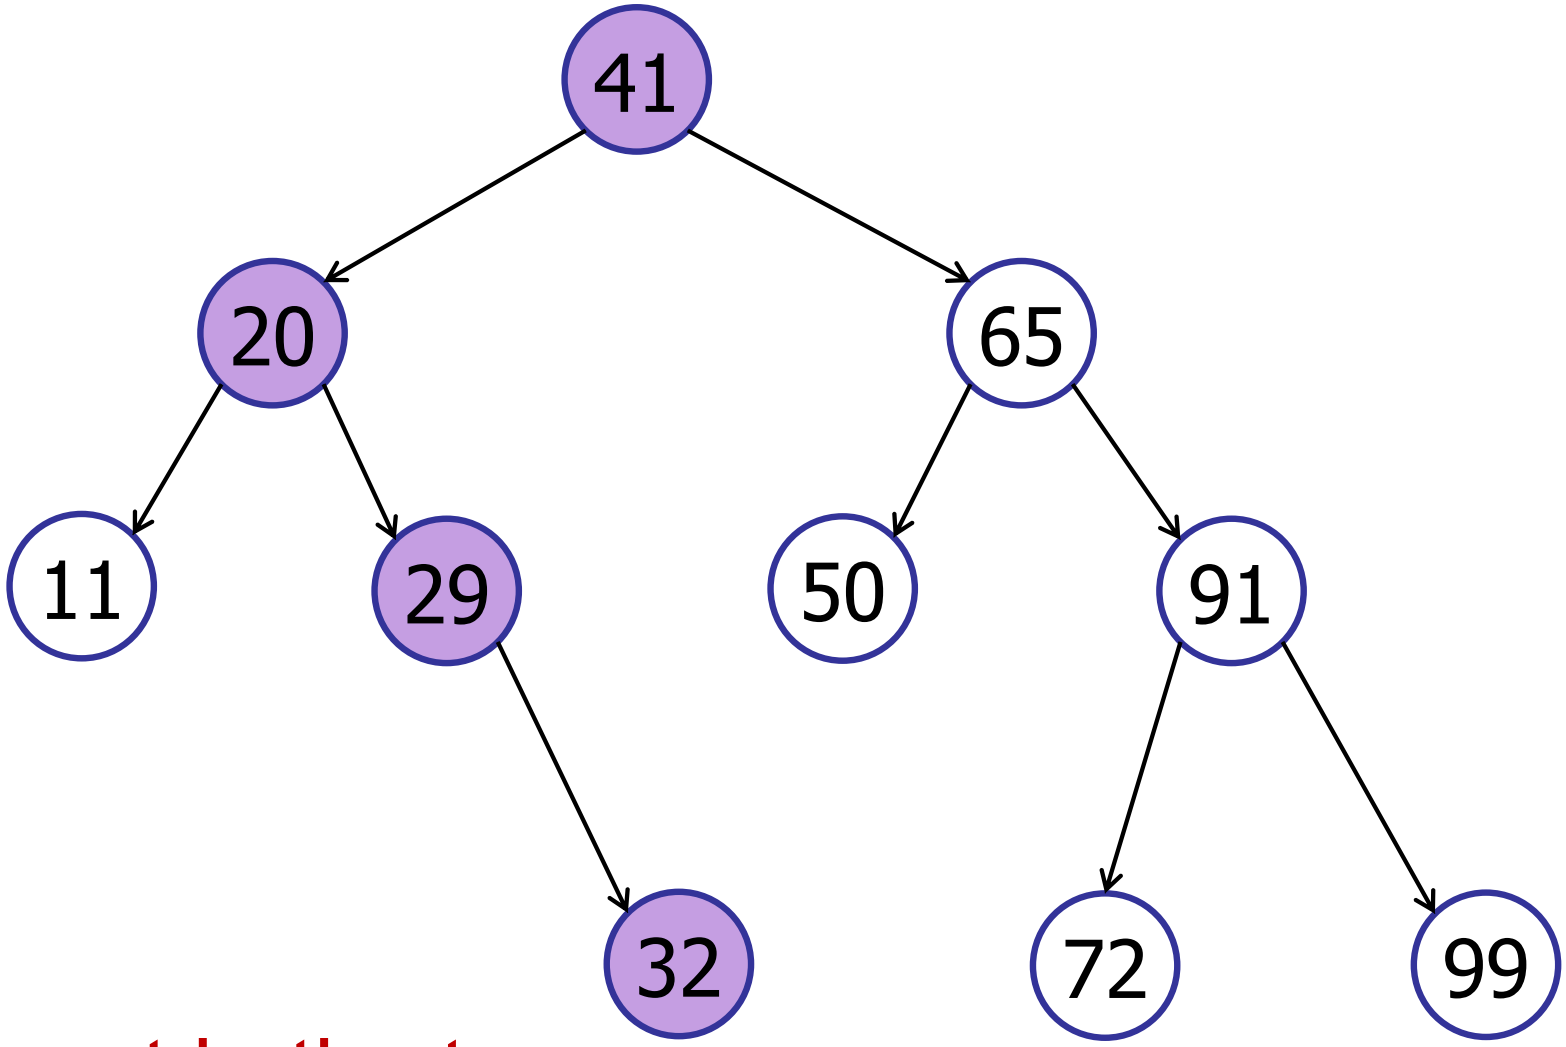
Successor Queries

Basic strategy: successor(key)

1. Search for key in the tree.
2. If (result > key), then return result.
3. If (result <= key), then search for successor of result.

Successor: Key not in the Tree

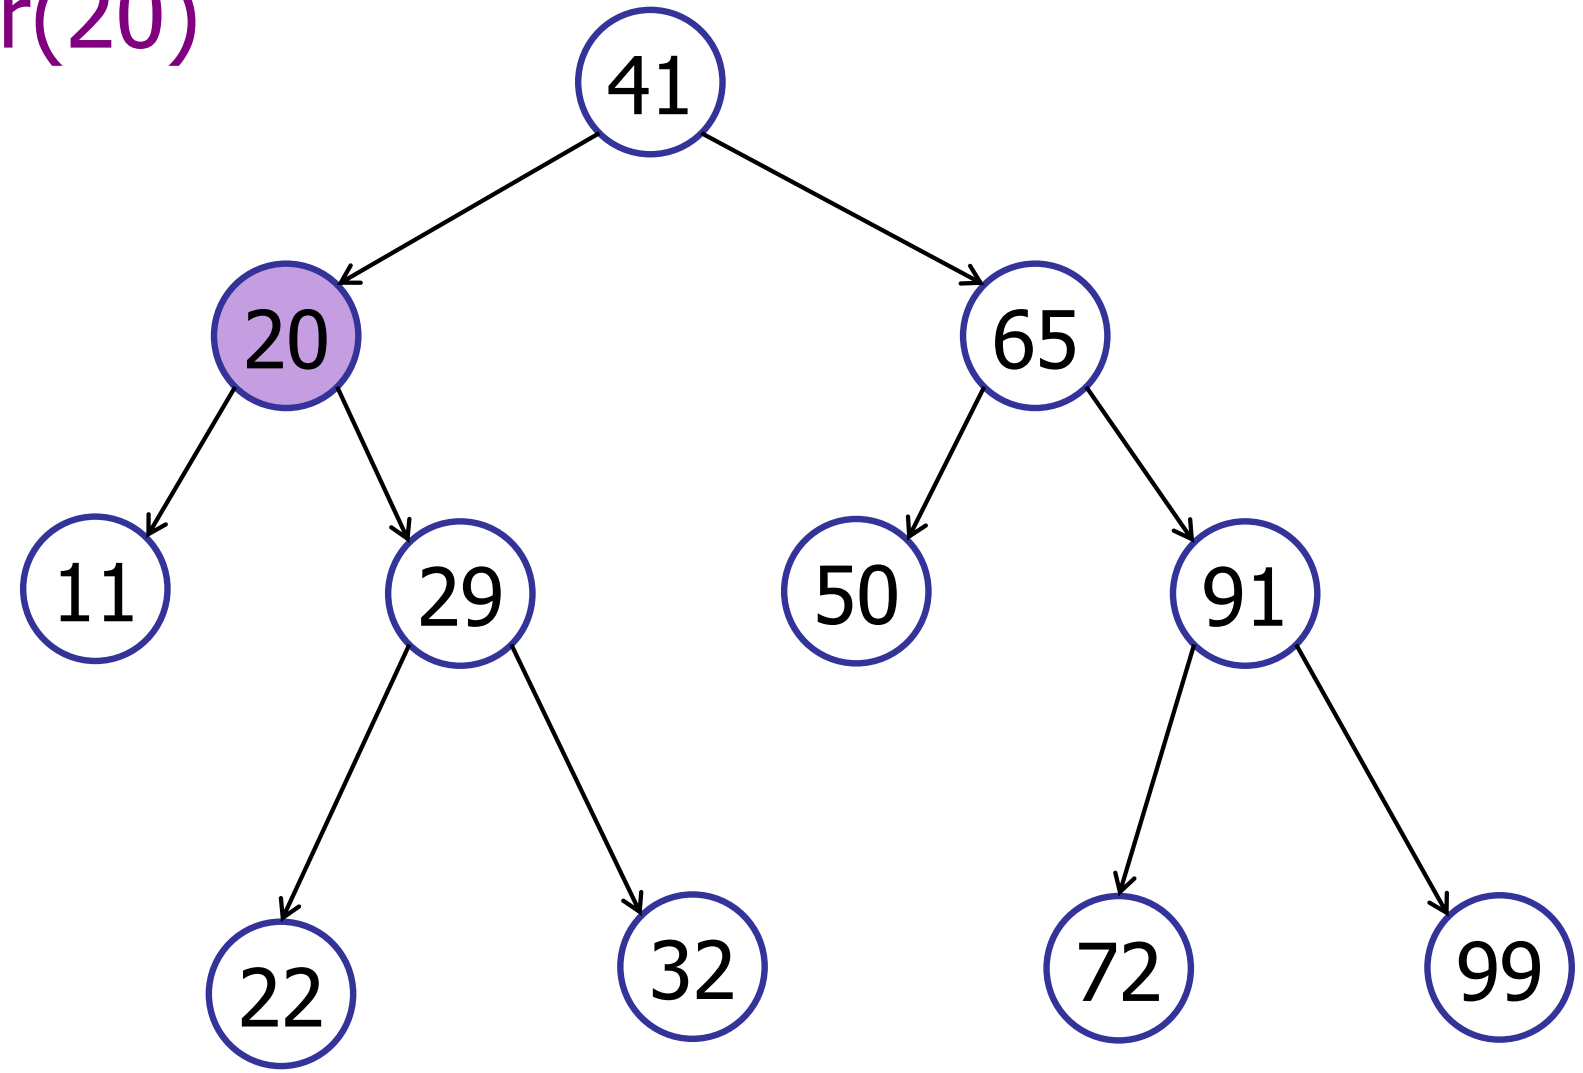
successor(33) = successor(32)



Key 33 is not in the tree

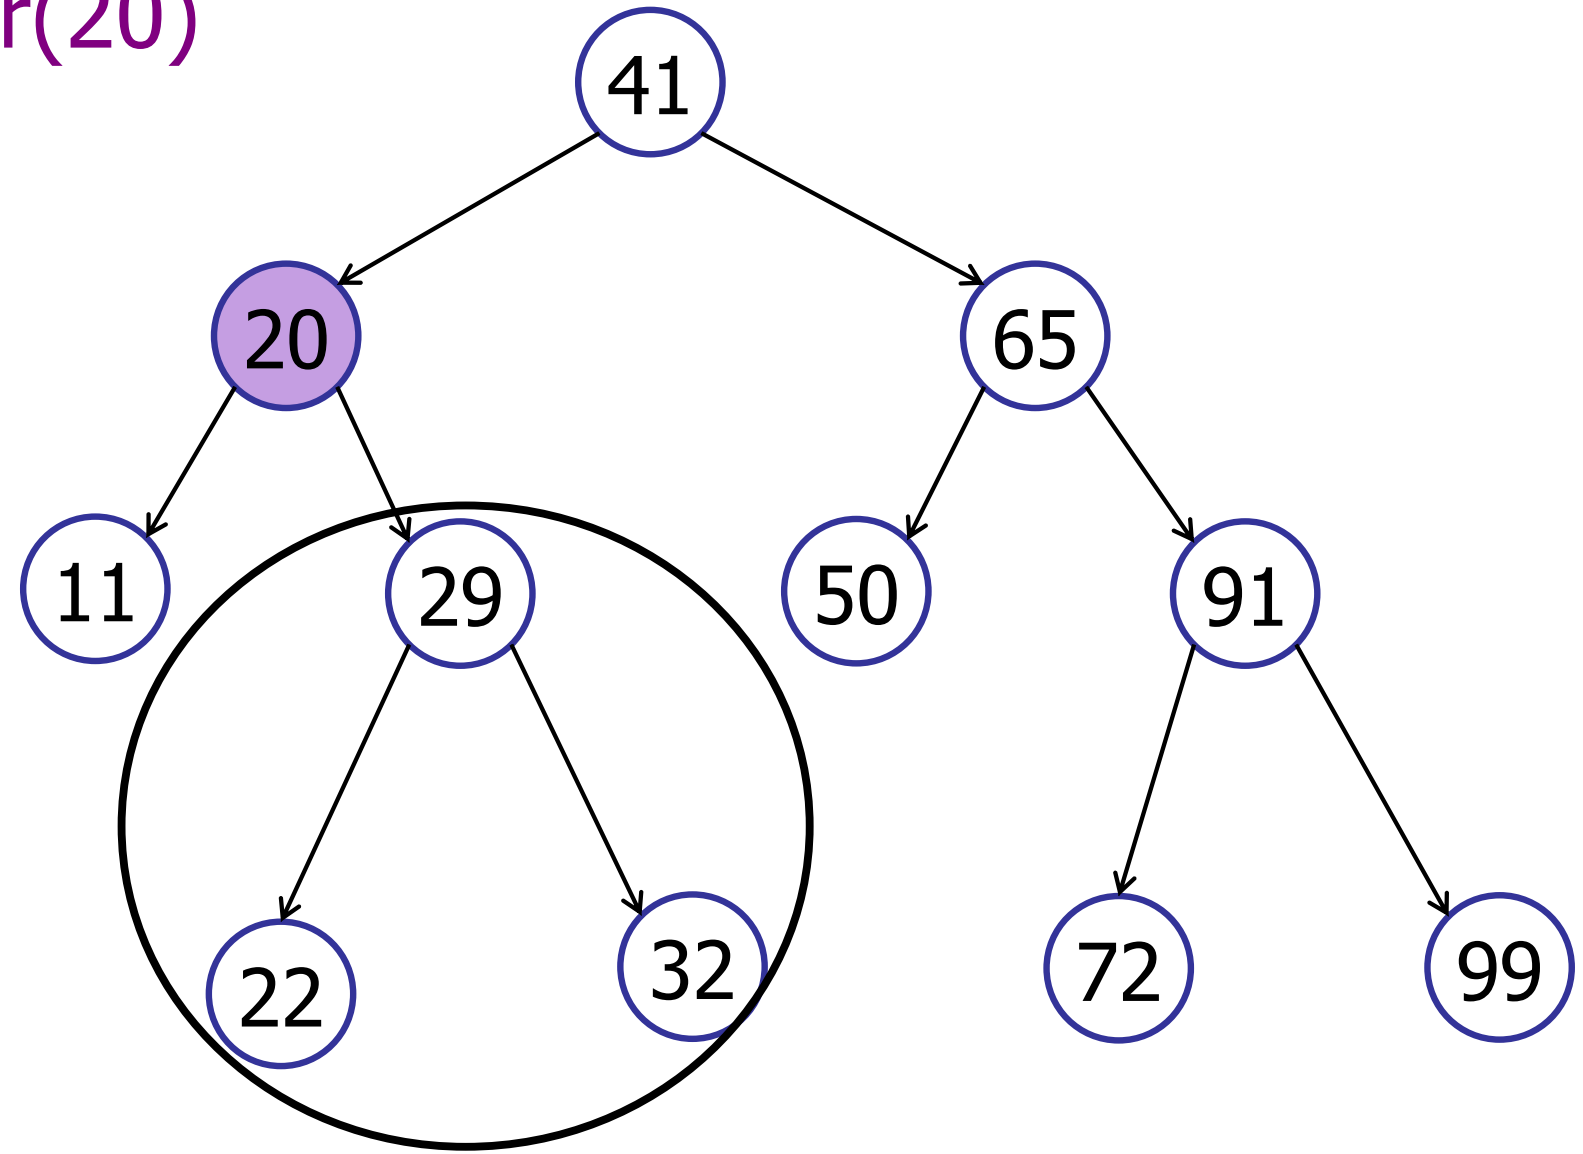
Successor: Key in the Tree

successor(20)



Successor Queries

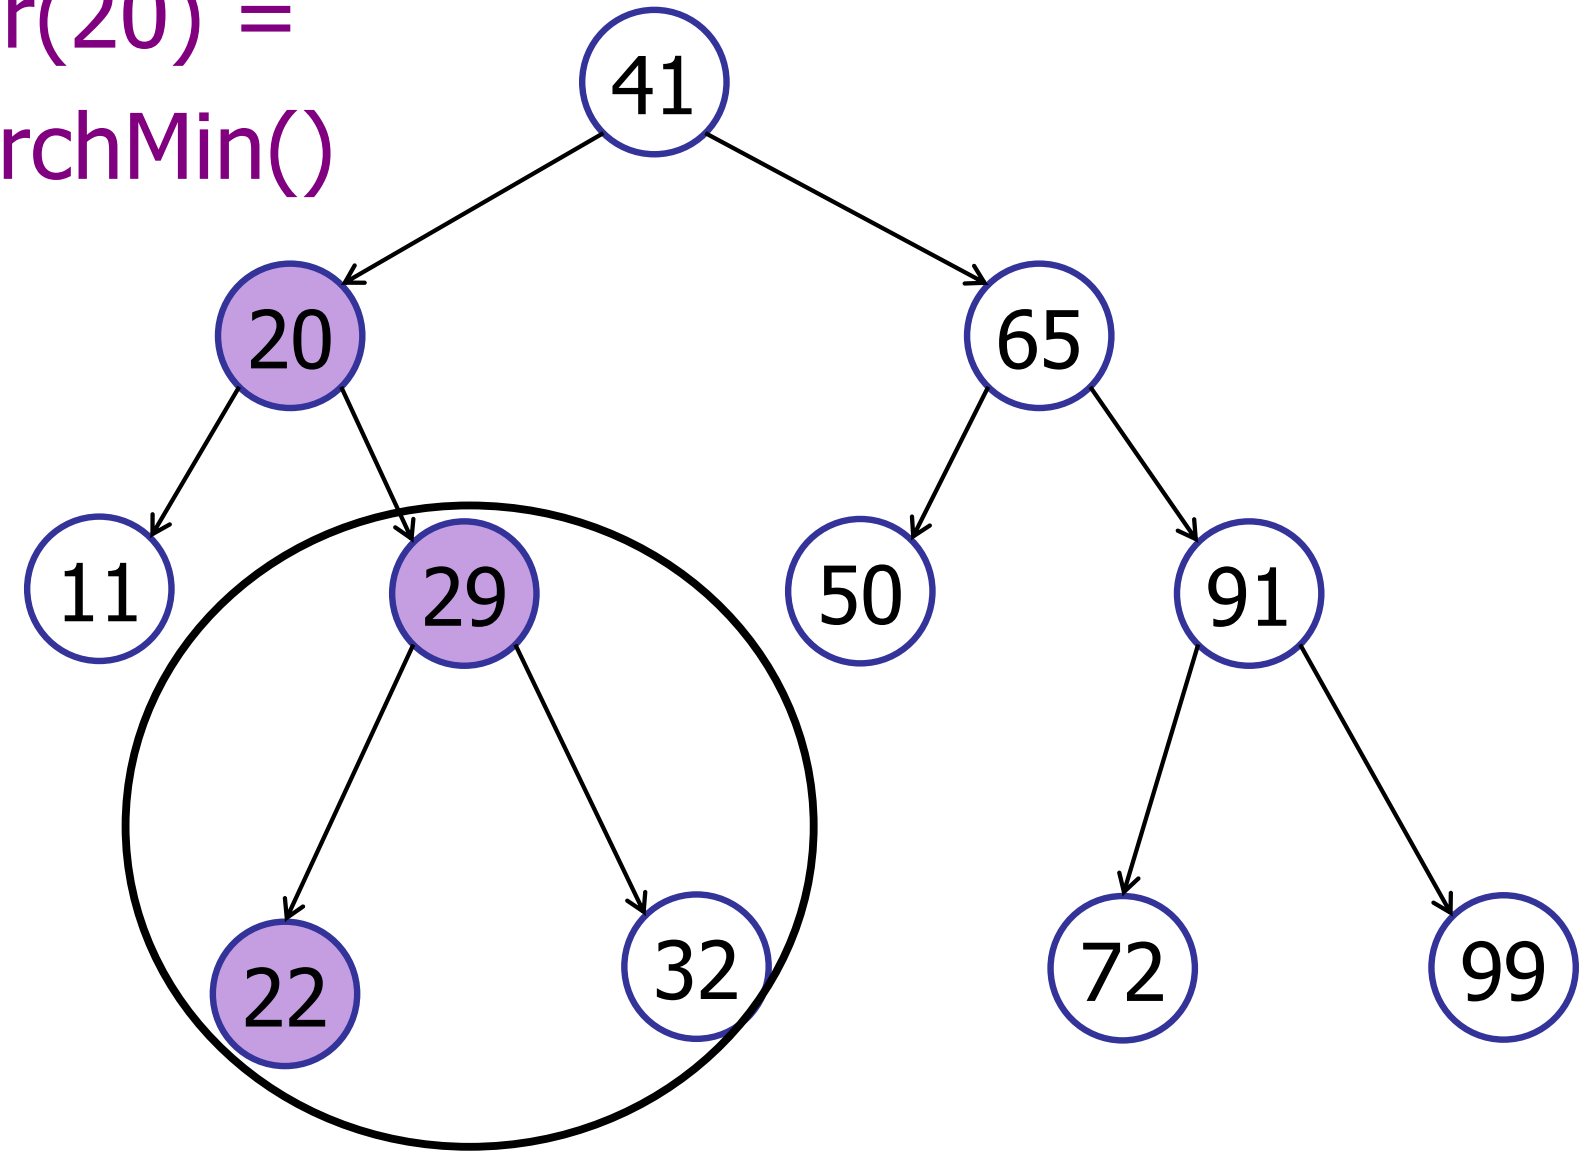
successor(20)



Case 1: node has a right child.

Successor Queries

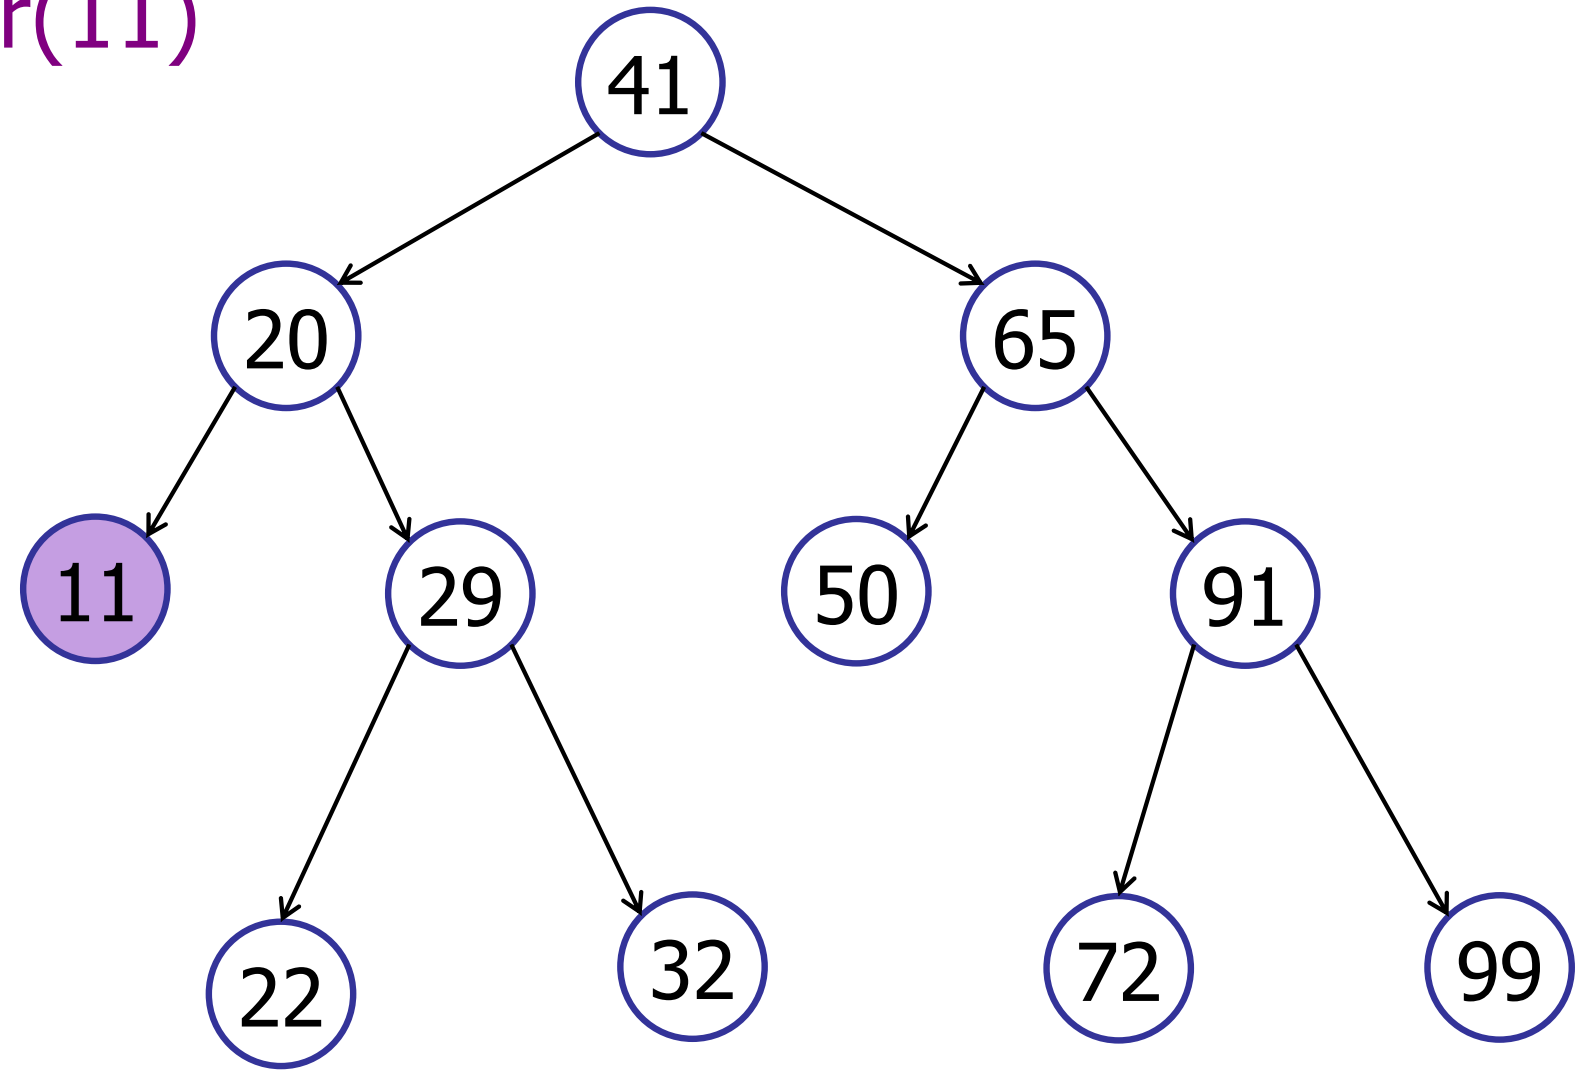
successor(20) =
right.searchMin()



Case 1: node has a right child.

Successor Queries

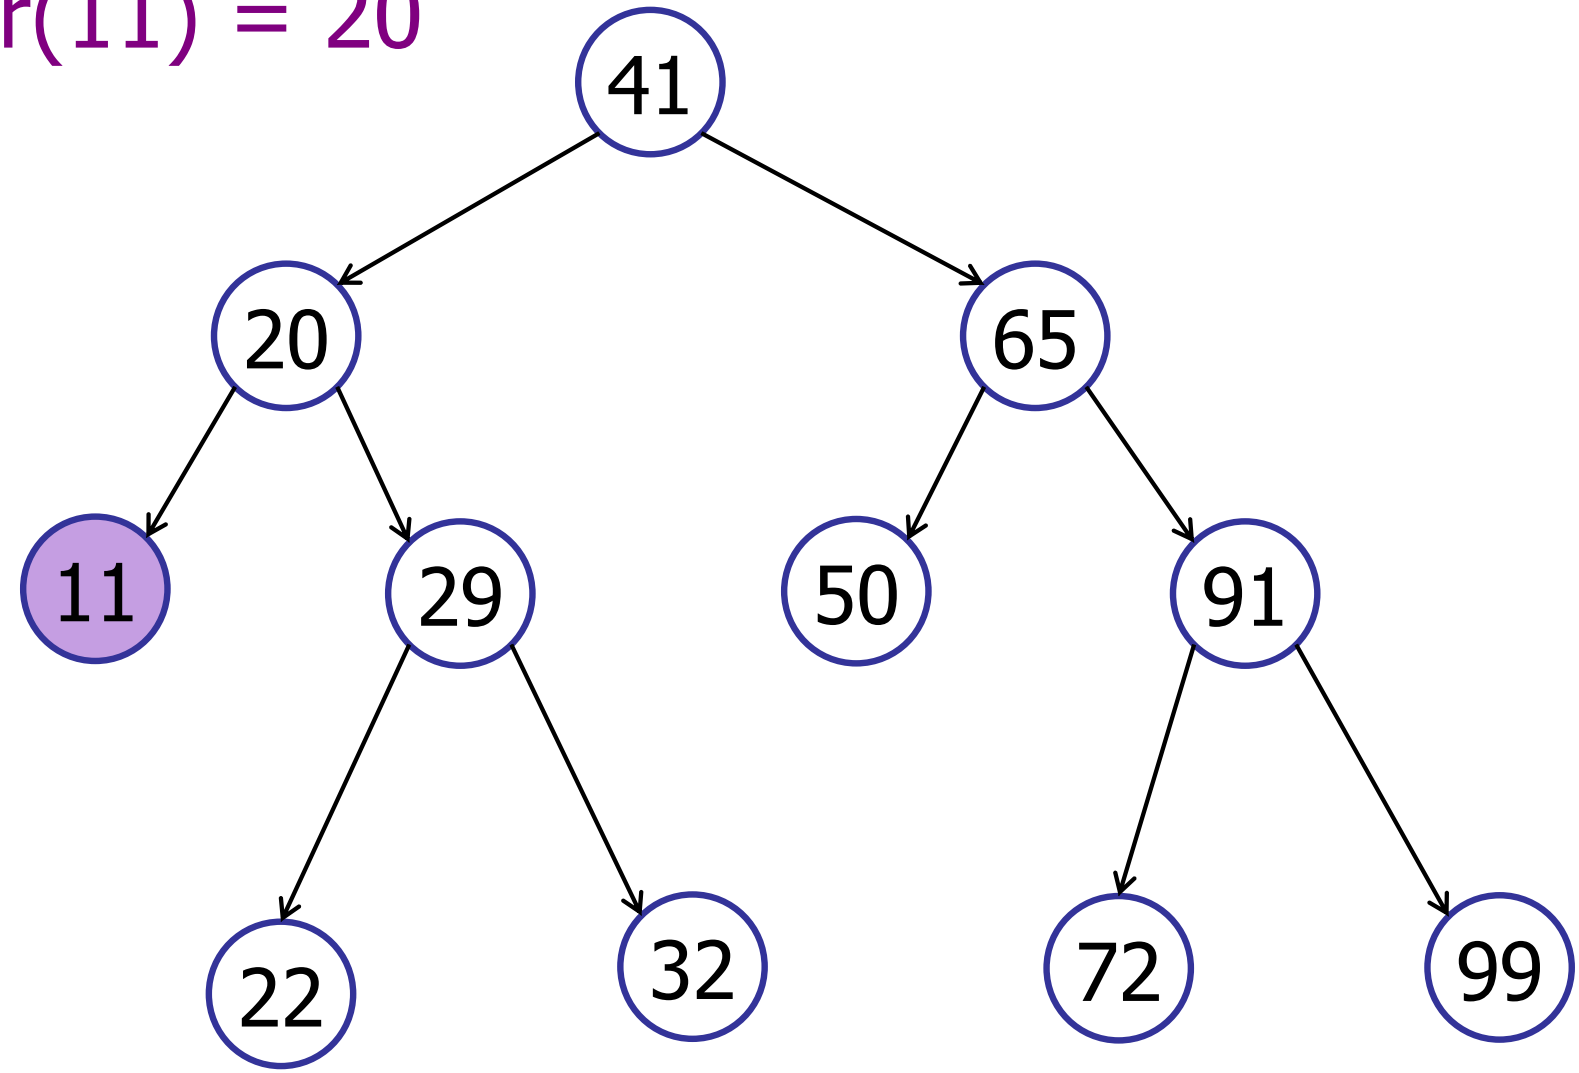
successor(11)



Case 2: node has no right child.

Successor Queries

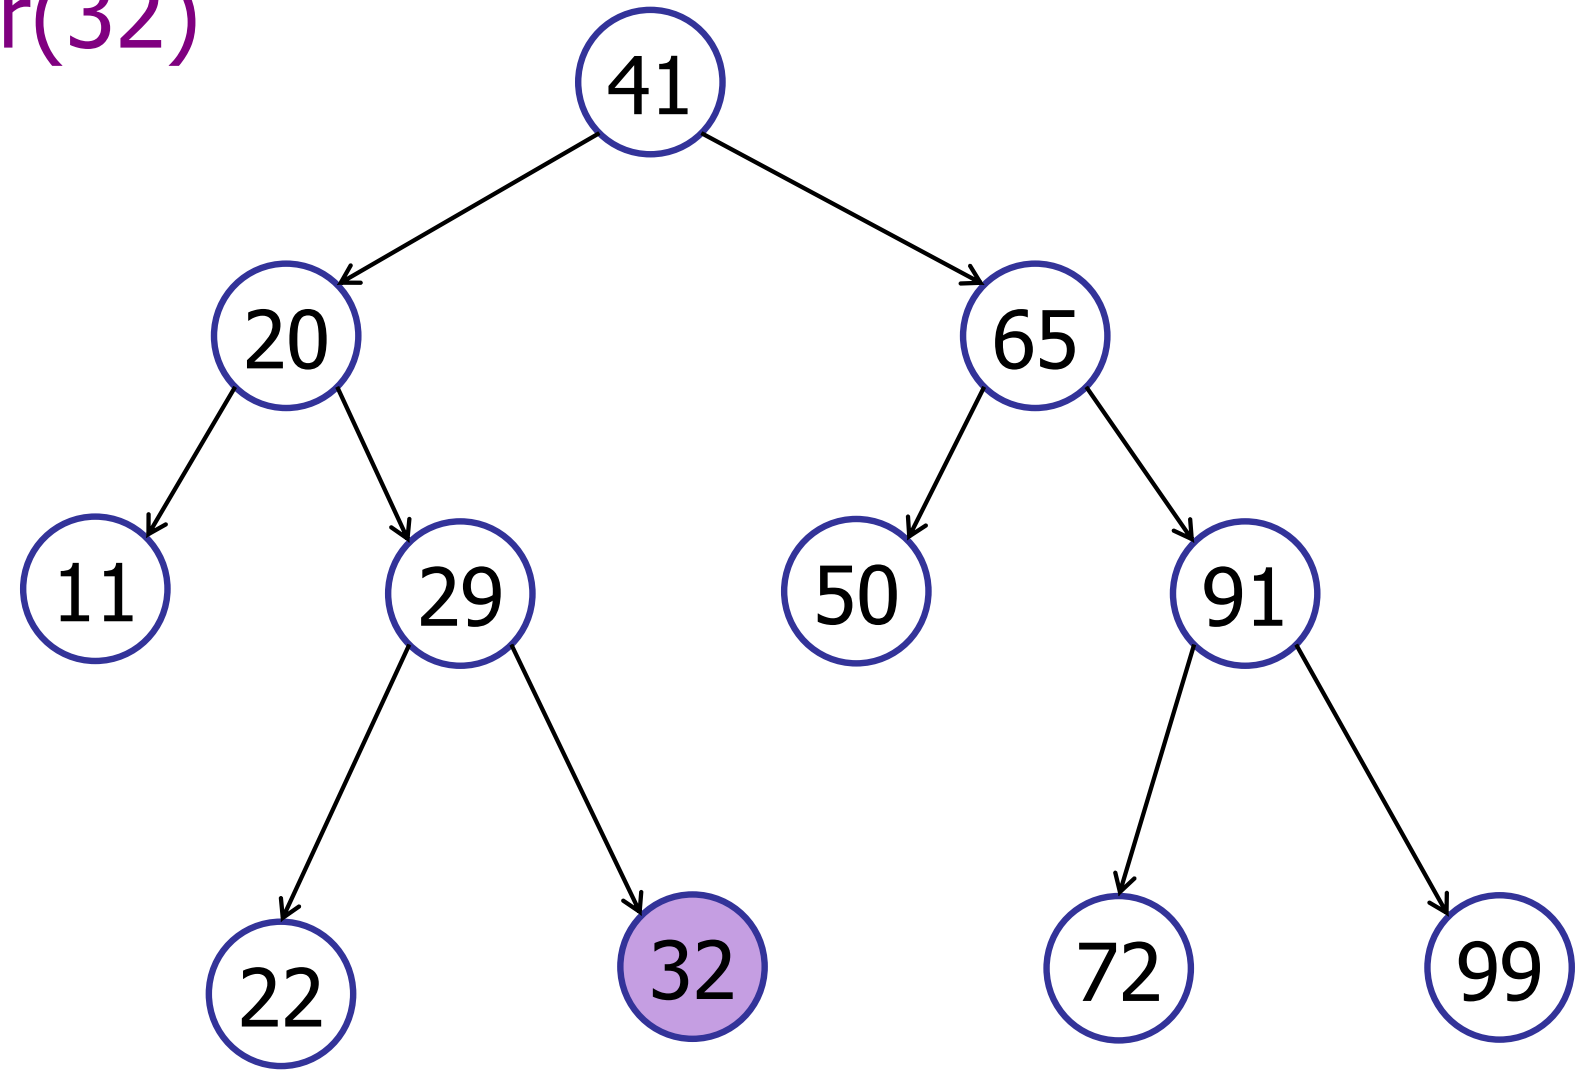
successor(11) = 20



Case 2: node has no right child.

Successor Queries

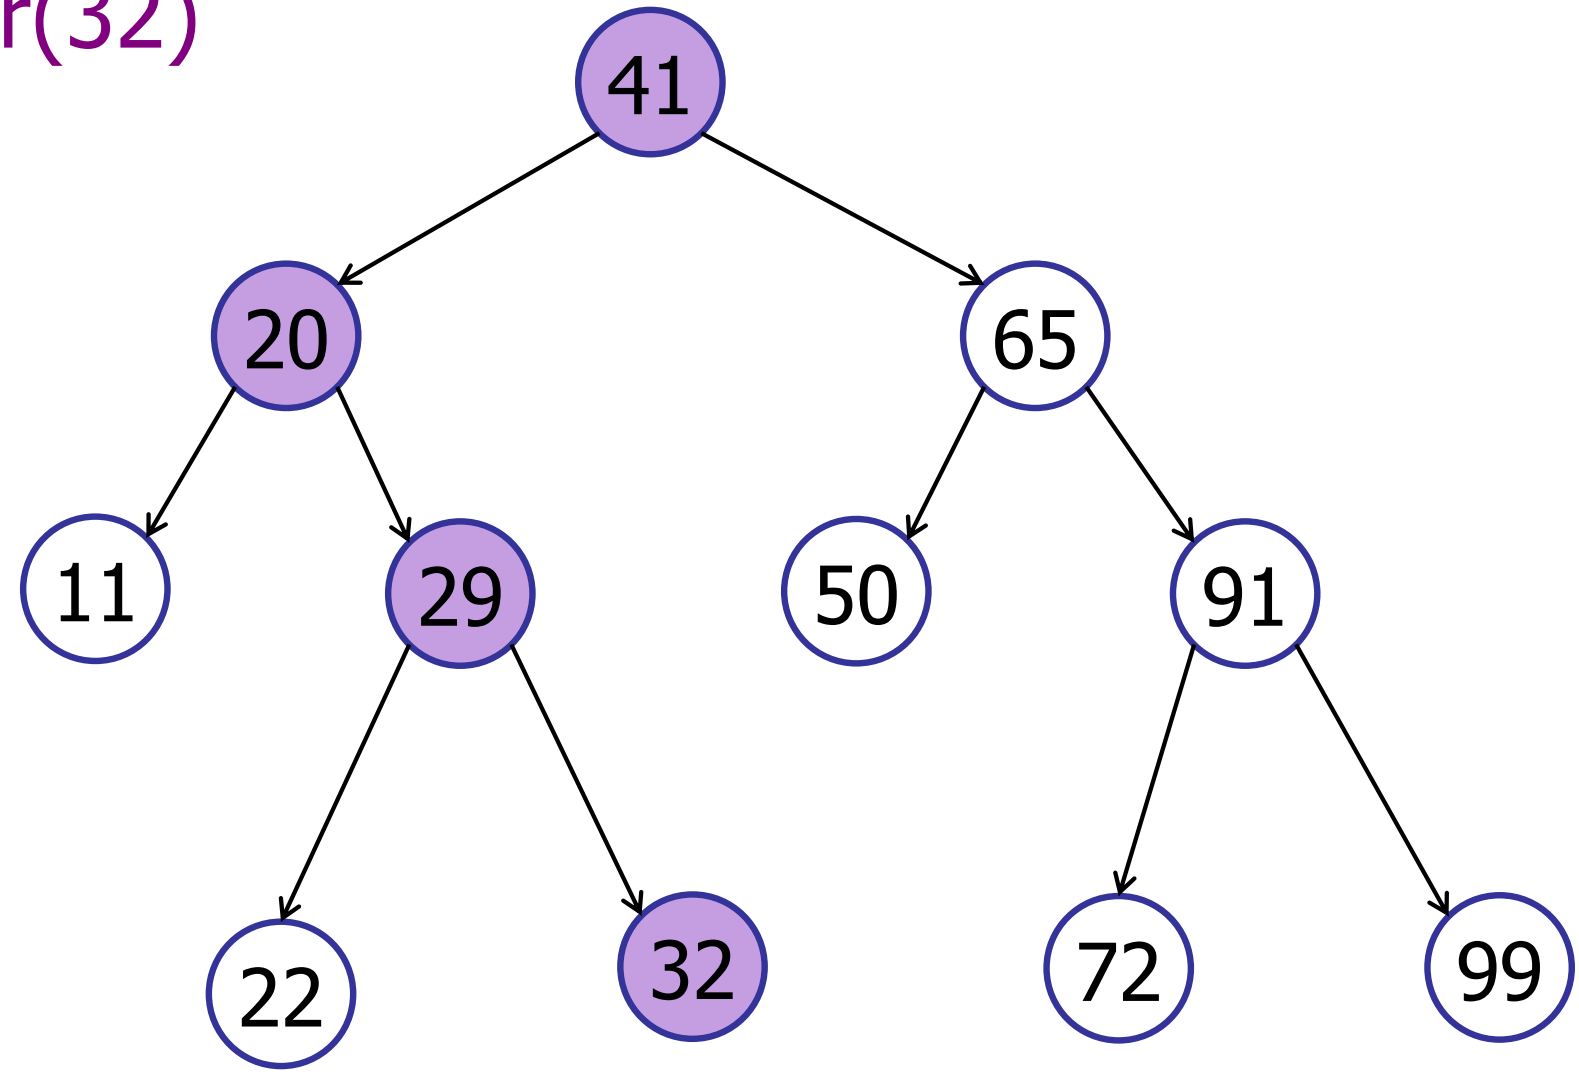
successor(32)



Case 2: node has no right child.

Successor Queries

successor(32)



Case 2: node has no right child.

Successor Queries

Find the next TreeNode:

```
public TreeNode successor(){
        if (rightTree != null)
                return rightTree.searchMin();

        TreeNode parent = parentTree;
        TreeNode child = this;
        while ((parent != null) && (child == parent.rightTree))
                child = parent;
                parent = child.parentTree;
        }
        return parent;
}
```

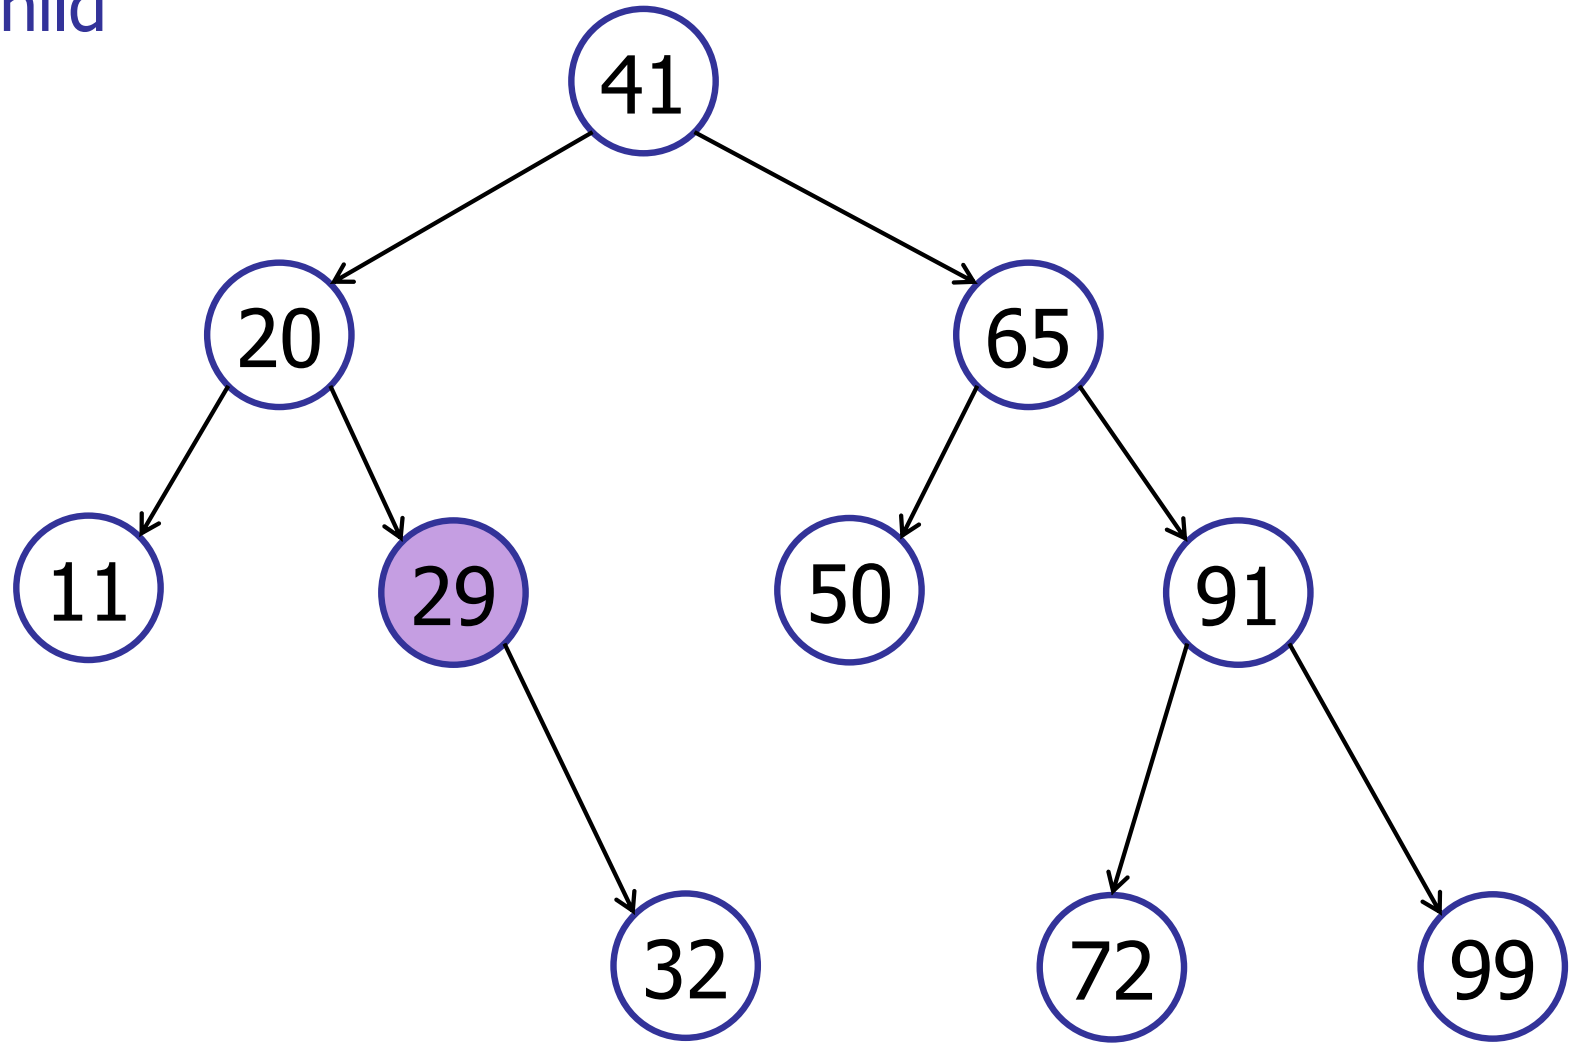
Case 2: 1 child



Binary Search Tree

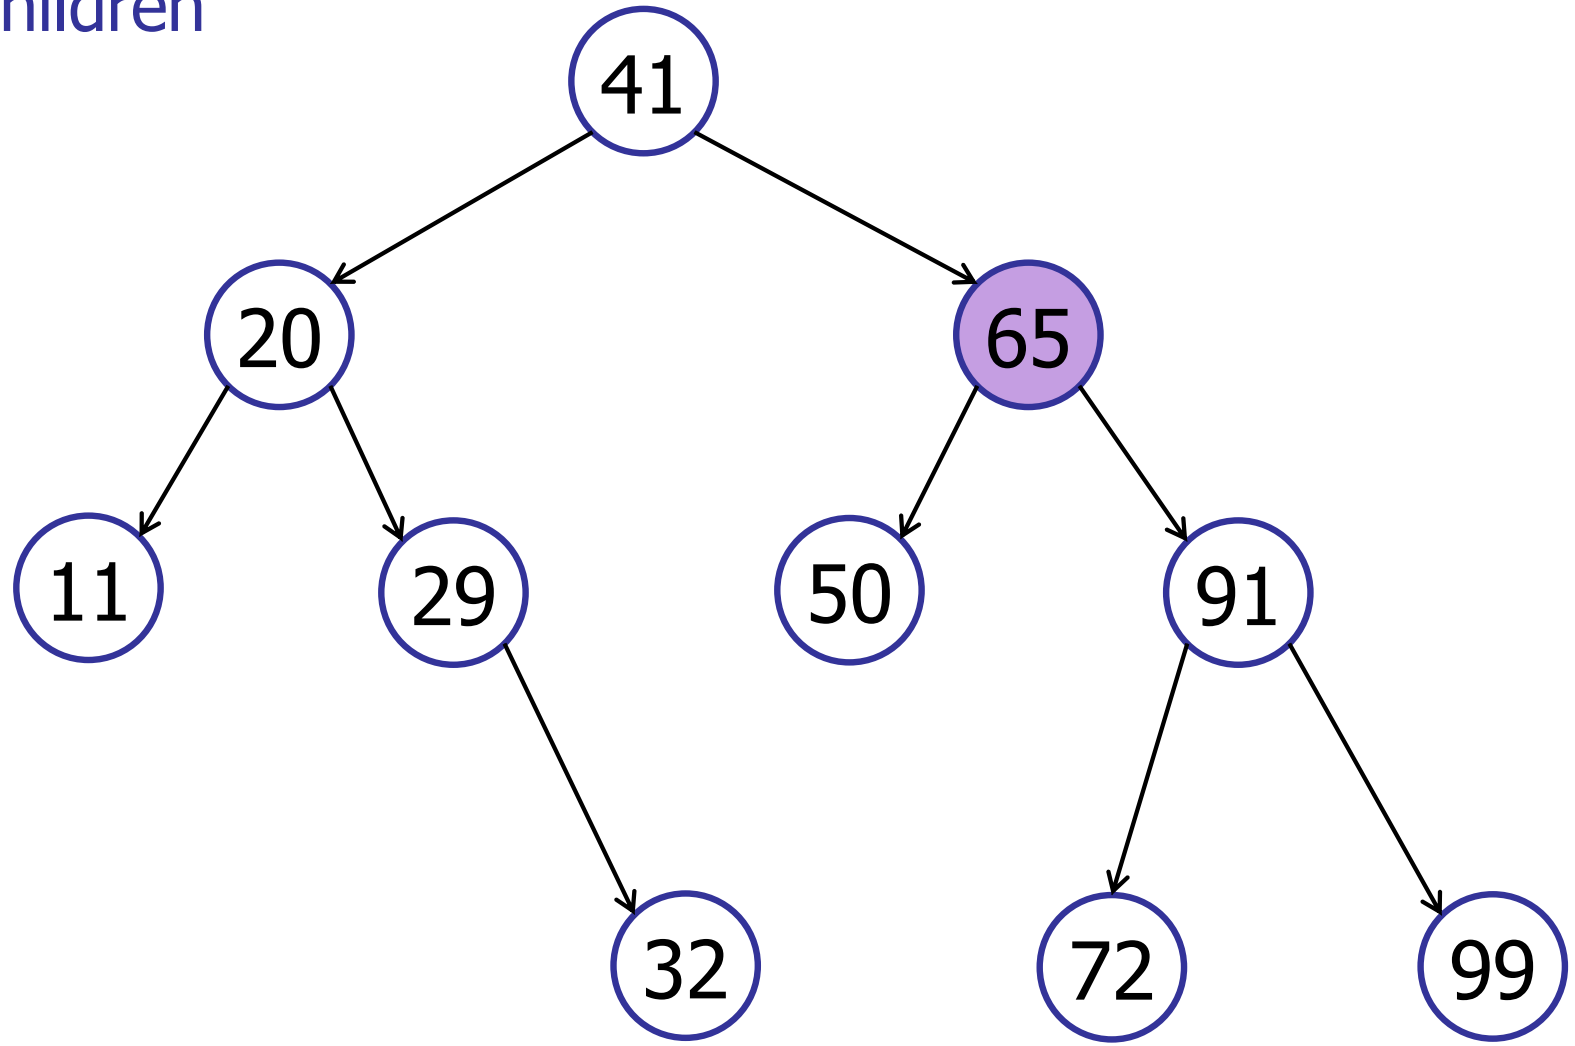
delete(65)

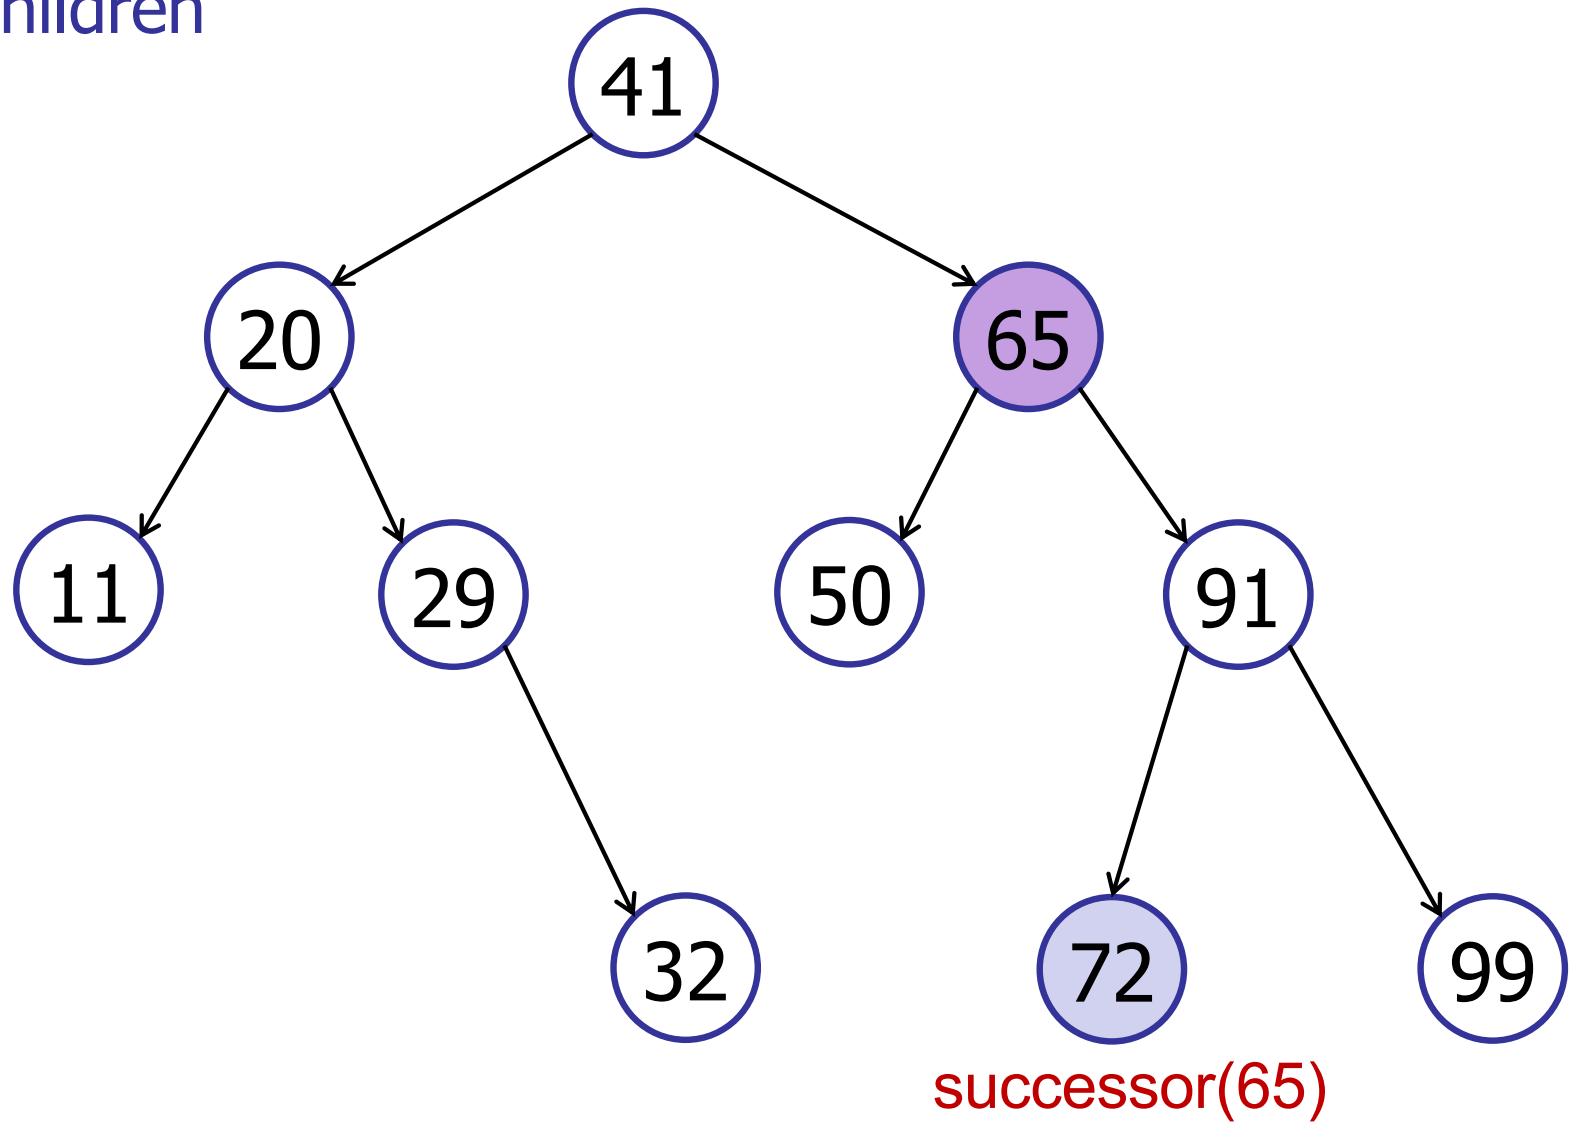
Case 3: 2 children



Binary Search Tree

delete(65)

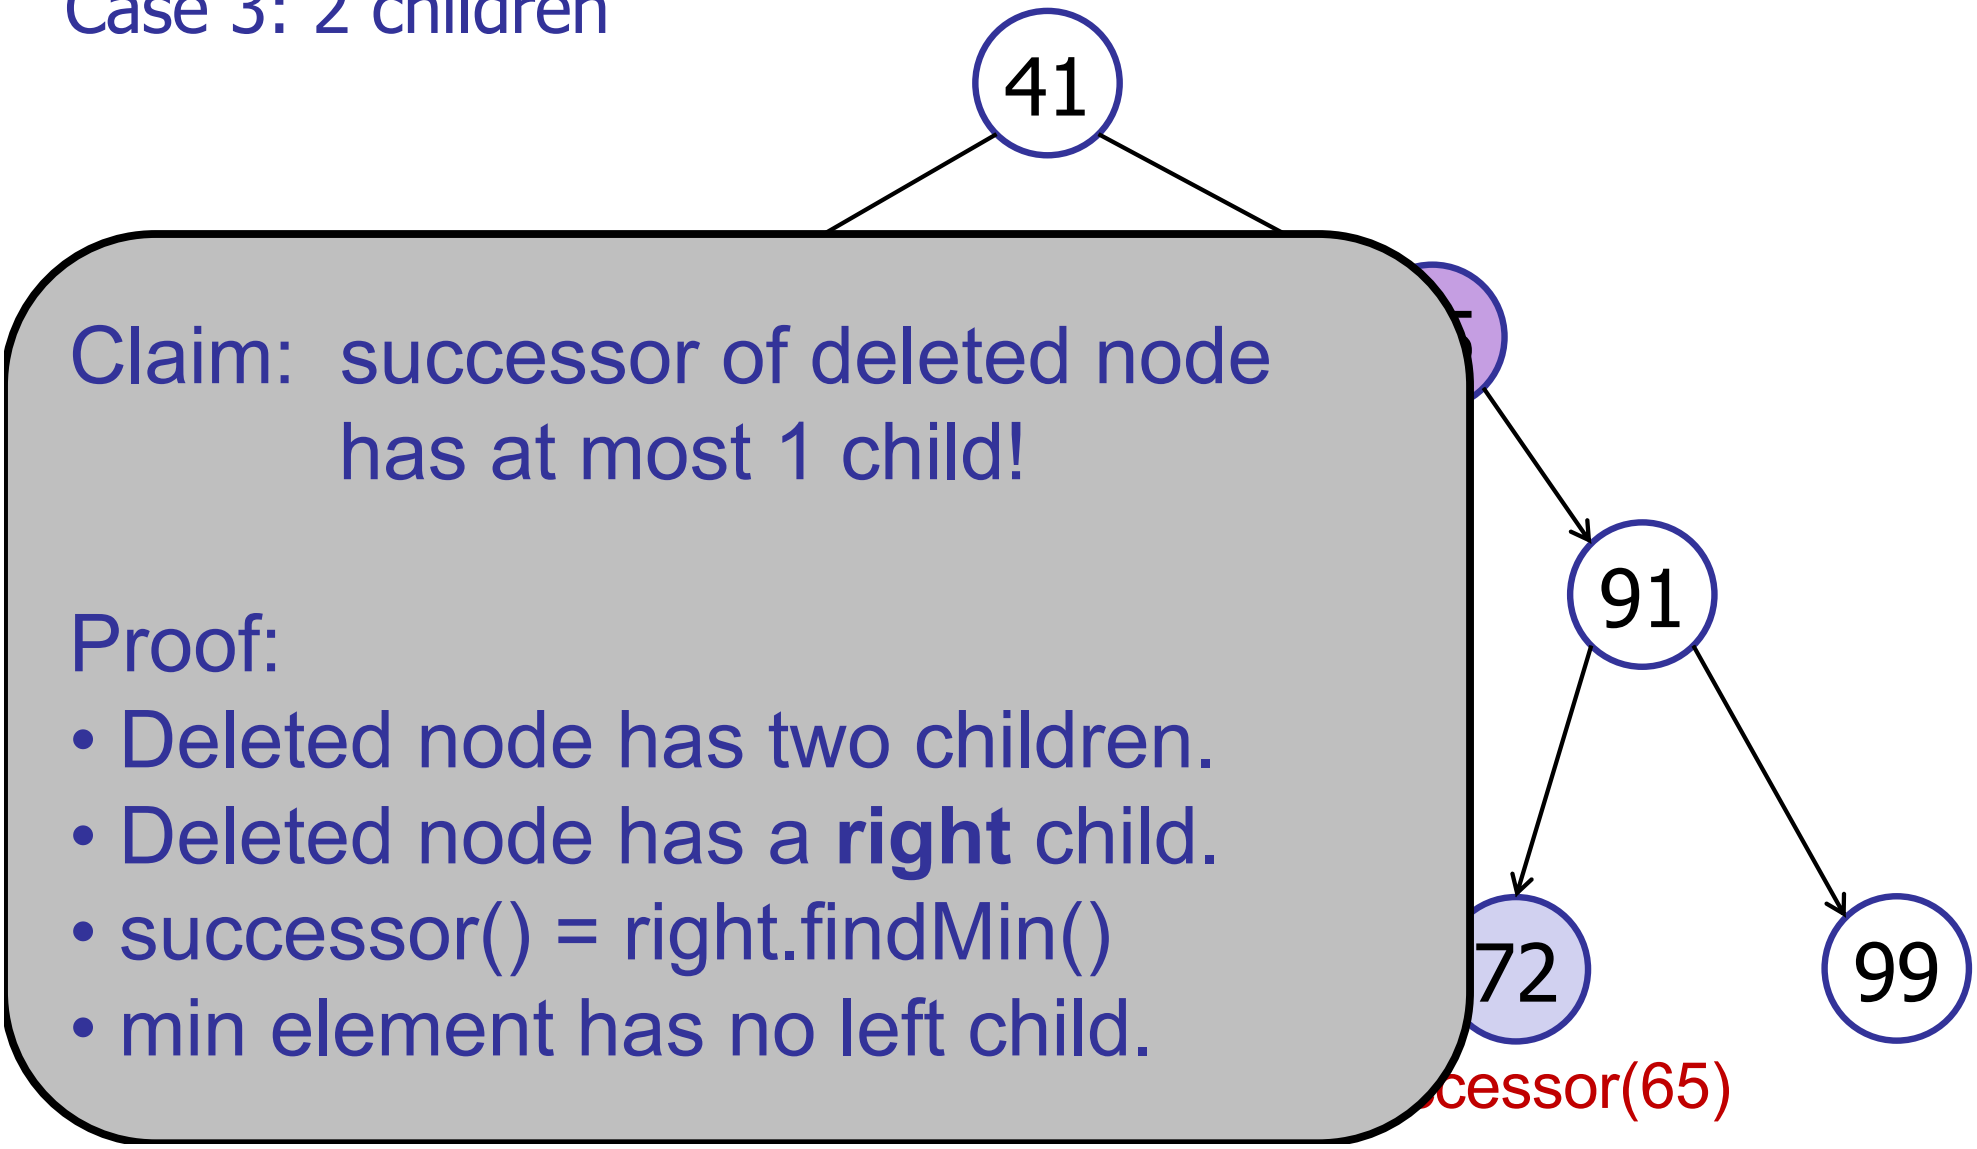
Case 3: 2 children



Binary Search Tree

delete(65)

Case 3: 2 children



Claim: successor of deleted node has at most 1 child!

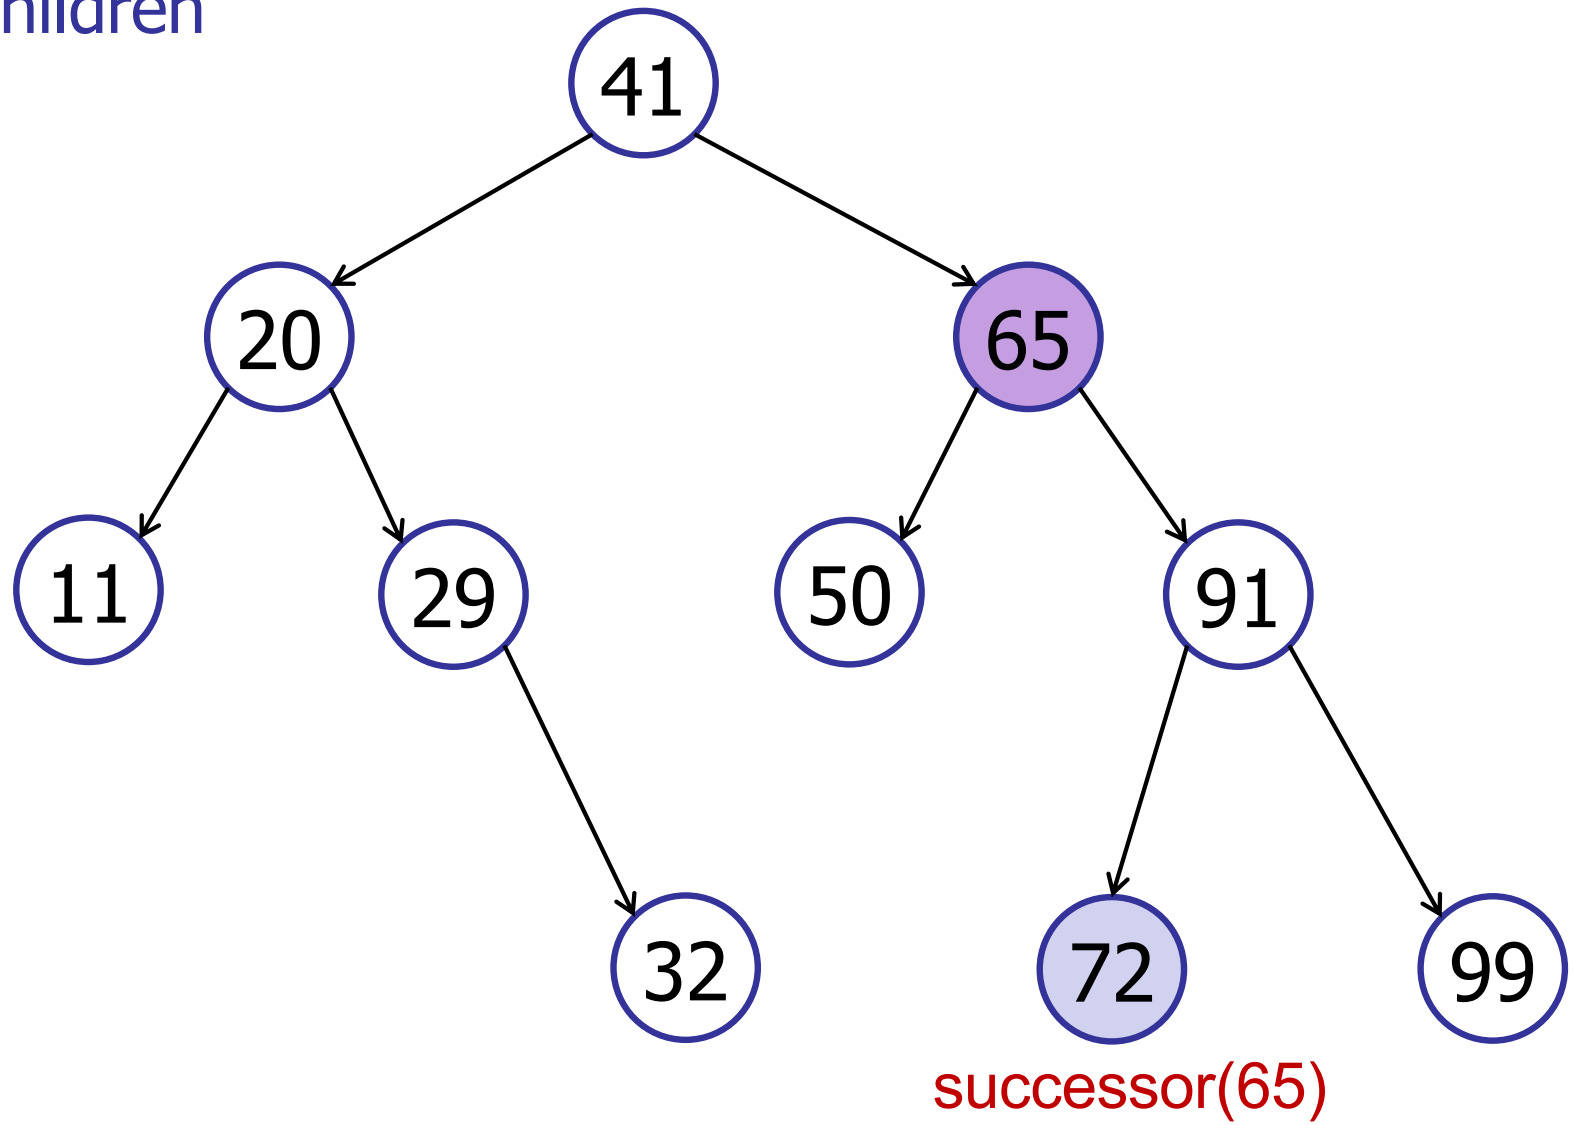
Proof:

- Deleted node has two children.
- Deleted node has a **right** child.
- successor() = right.findMin()
- min element has no left child.

Binary Search Tree

delete(65)

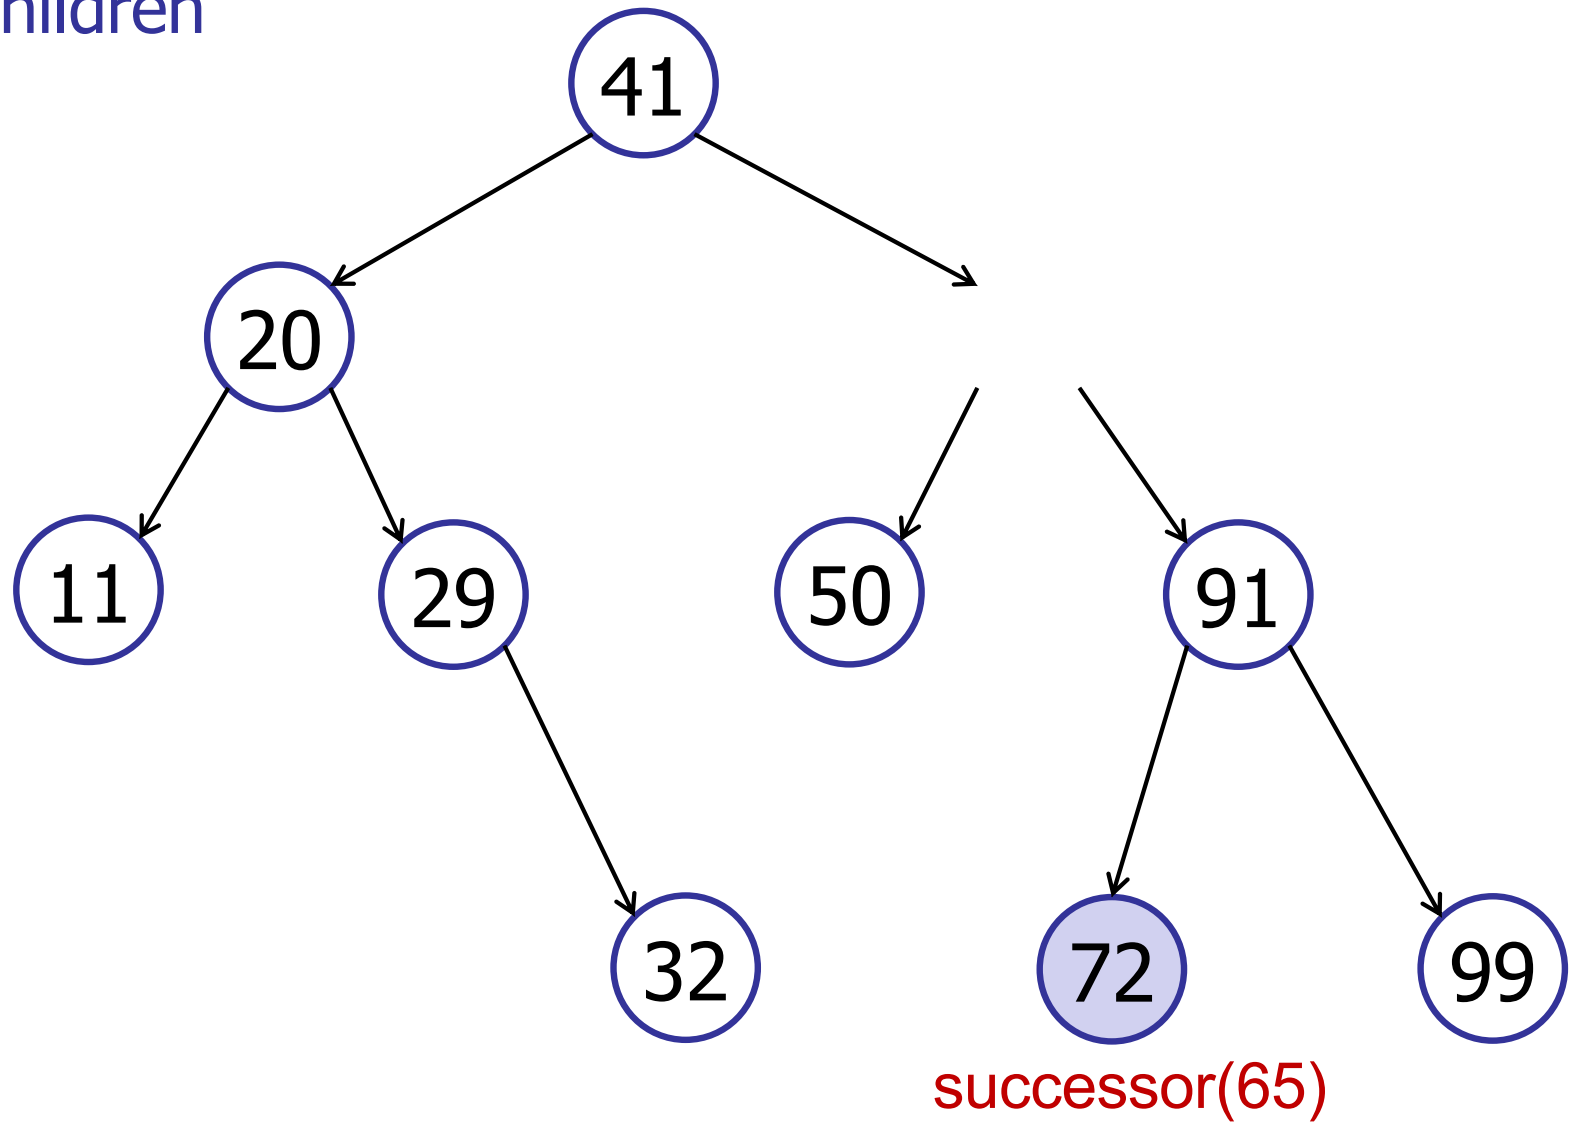
Case 3: 2 children



Binary Search Tree

delete(65)

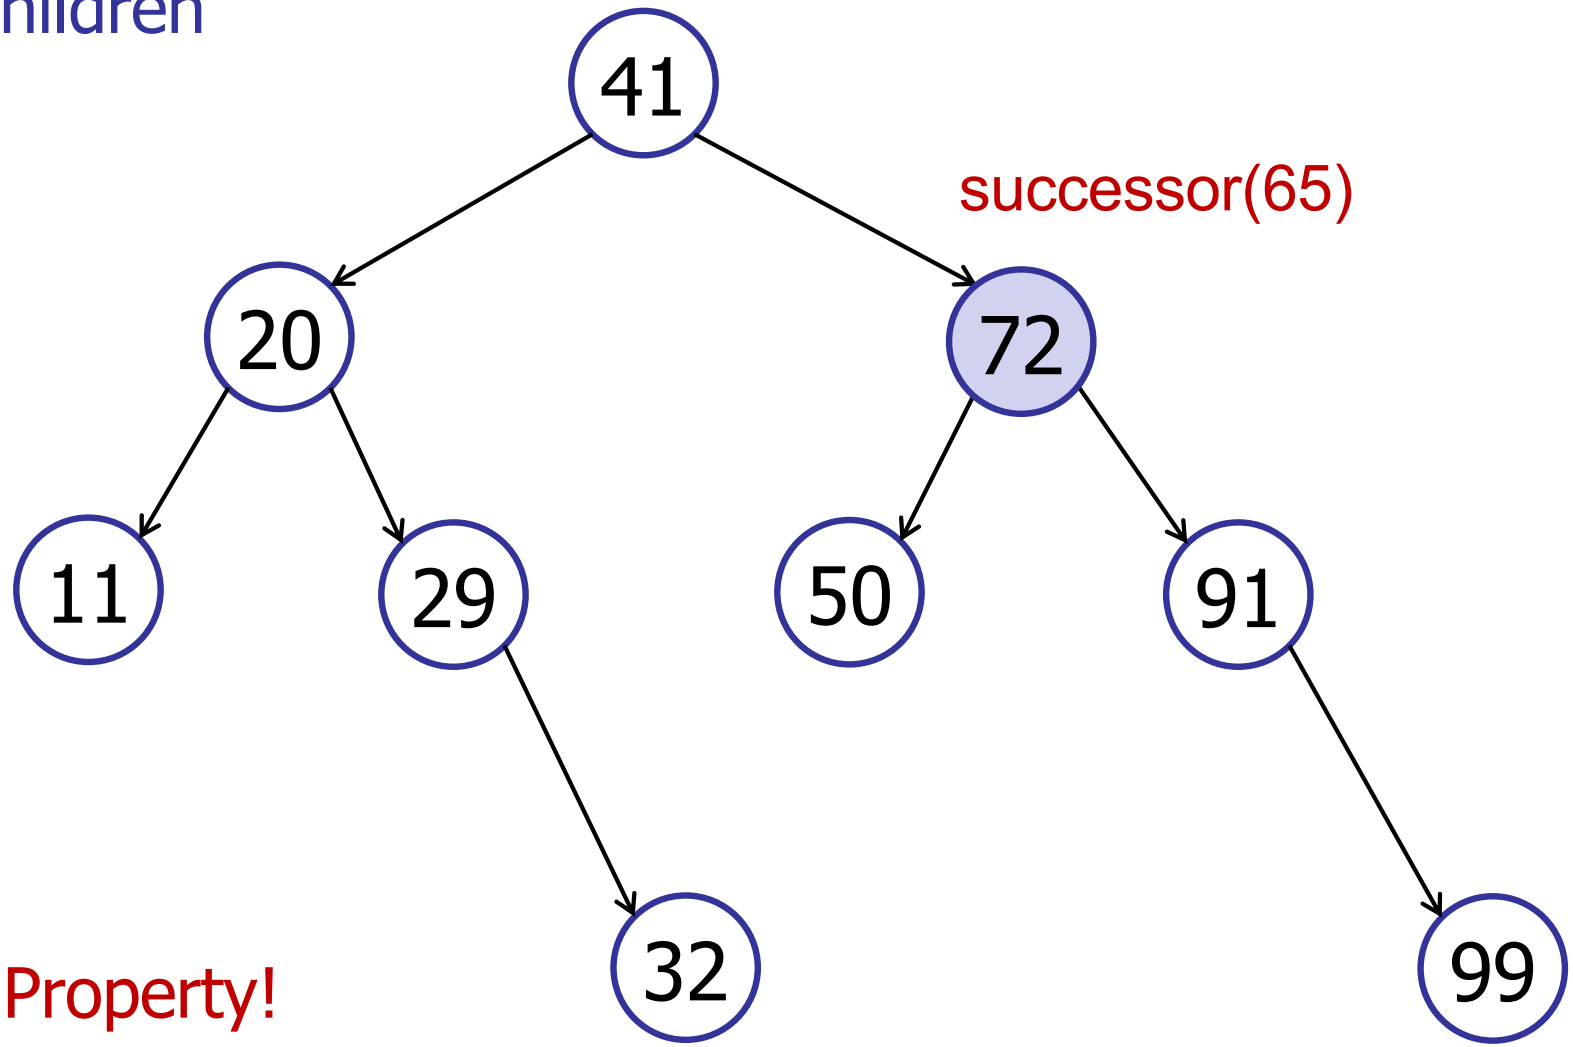
Case 3: 2 children



Binary Search Tree

delete(65)

Case 3: 2 children



Check BST Property!

Binary Search Tree

delete(v) Running time: O(height)

Three cases:

1. No children:
   - remove v
2. 1 child:
   - remove v
   - connect child(v) to parent(v)
3. 2 children
   - x = successor(v)
   - delete(x)
   - remove v
   - connect x to left(v), right(v), parent(v)

Binary Search Tree

Modifying Operations

- insert: O(h)
- delete: O(h)

Query Operations:

- search: O(h)
- predecessor, successor: O(h)
- findMax, findMin: O(h)
- in-order-traversal: O(n)

Plan of the Day
